

Tables

- 1.1 Subreach Boundaries for Study Area of San Joaquin River from Friant Dam to Merced River Confluence
- 1.2 Important Features in Study Area
- 1.3 Dominant Riverside Land Use by River Reach
- 1.4 Design Flow Capacities for the Bypass Flood Control System (Corps, 1993)
- 2.1 Cross Sections and Water Surface/Energy Slopes
- 3.1 Peak Flow Frequency Data Derived from WRC Bulletin 17b Analysis of Existing Gage Records for the Indicated Time Periods
- 3.2 Median (Q_{50}) discharges (cfs) developed from mean daily discharge flow duration curves for the indicated gages on the San Joaquin River, Mud Slough and Salt Slough
- 3.3 Channel capacities and design discharges for selected cross sections in existing hydraulic models of reaches of the San Joaquin River
- 3.4 Computed Bankfull Discharges at Selected 1914 CDC Cross Sections in the Project Reach of the San Joaquin River
- 3.5 Computed Bankfull Discharges at Selected 1998 Cross Sections in the Project Reach of the San Joaquin River
- 4.1 Valley Floor and Channel Morphometric Characteristics for Identified Subreaches of San Joaquin River
- 4.2 Bankfull Morphometric Characteristics of Sloughs in Lower Subreaches of the San Joaquin River
- 4.3 Comparison of Channel Morphometric Characteristics Between 1914 and 1998
- 4.4 Changes in Thalweg Elevation at Resurveyed Cross Sections in Identified Subreaches of San Joaquin River
- 4.5 Changes in Thalweg Elevation at Bridges Across San Joaquin River And Eastside Bypass (Source of Data Is Caltrans)
- 4.6 Sediment Characteristics in San Joaquin River and Eastside Bypass

- 5.1 Generalized Patterns of Riparian Habitat by River Reach
- 6.1 Potential Soil Suitability for Riparian Restoration According to Soil Association Mapping Units
