General

This year is the thirty-eighth consecutive year that an Annual Operating Plan (AOP) has been prepared for the federally owned dams and reservoirs serving an irrigation function in the Niobrara, Lower Platte, and Kansas River Basins. The plan has been developed by the Water Control Field Branch, McCook, Nebraska for the 17 dams and reservoirs that are located in Colorado, Nebraska, and Kansas. These reservoirs, together with 10 diversion dams, 11 pumping plants, and 25 canal systems, serve approximately 307,500 acres of project lands in Nebraska and Kansas. In addition to irrigation and municipal water, these features serve flood control, recreation, and fish and wildlife purposes. A map in the appendix of this report shows the location of these features. Davis Creek Dam is a feature of the North Loup Division and was completed this past year. The first stage of the reservoir filling process is scheduled to begin this spring.

Public Law 101-359 dated August 10, 1990, changed the name of Calamus Dam to Virginia Smith Dam effective January 3, 1991.

The reservoirs in the Niobrara and Lower Platte River Basins are operated by either irrigation or reclamation districts, and the reservoirs in the Kansas River Basin are operated by either the Bureau of Reclamation (Reclamation), or the Corps of Engineers. Virginia Smith and Davis Creek Dams are operated and maintained by the Twin Loups Reclamation District under an agreement with Reclamation. Kirwin Irrigation District provides operational and maintenance assistance for Kirwin Dam. The diversion dams, pumping plants, and canal systems are operated by either irrigation or reclamation districts.

A Programmable Master-Station Supervisory Control System located at McCook is used to assist in operational management of all eleven dams under Reclamation's jurisdiction that are located in the Kansas River Basin.

The Headlines 90 that follows this synopsis is indicative of the awareness of the local people of the natural resource development and conservation in the Niobrara, Lower Platte, and Kansas River Basins.

1990 Summary

Climatic Conditions

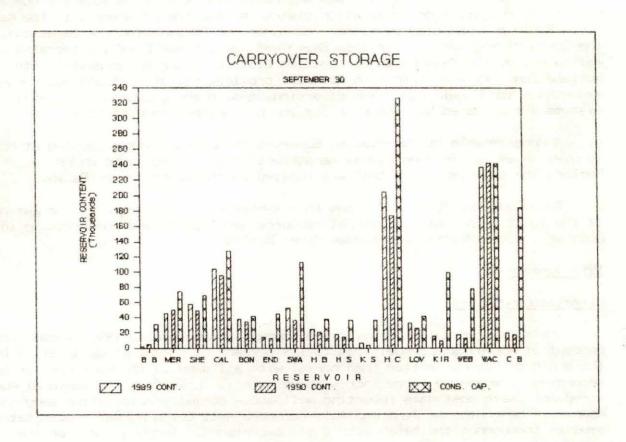

The total precipitation over the operating area during 1990 ranged from 82 percent of normal at Lovewell Dam to 129 percent of normal at Cedar Bluff Dam. The month of May was wetter than normal with all dams in the Kansas River Basin recording from one to three inches above normal. Likewise, the month of August fared well with most dams reporting well above normal precipitation amounts. However, the months of June and July recorded well below normal precipitation amounts throughout the basin with a few exceptions. Temperatures for the months of January and November averaged well above normal during 1990. The warmest temperatures in 1990 were experienced during the last week of June and the first week of July when several daily highs exceeded the 100 degree mark. The coldest temperatures occurred in the last ten days of the year with temperatures dropping to nearly 20 degrees below zero over much of the projects area. March was an active month with a record breaking 17 tornadoes reported in Nebraska on March 14. Kansas also reported several tornadoes during the month. Planting of crops occurred 10 to 14 days earlier than normal. Fall harvest conditions were excellent.

Storage Reservoirs

1. Conservation Operations. The 1990 inflows were below the dry-year forecast at Box Butte, Cedar Bluff, Enders and Bonny Reservoirs and Swanson, Hugh Butler, Harry Strunk and Harlan County Lakes. Keith Sebelius and Waconda Lakes and Kirwin and Webster Reservoirs had inflows between the dry- and normal-year forecasts. Lovewell, Sherman, Merritt, and Calamus Reservoirs had inflows between the normal- and wet-year forecast.

Carryover storage in the Nebraska-Kansas Projects reservoirs at the end of September was approximately 73,000 A.F. less than it was in 1989. Several reservoirs were at or near a ten year low in reservoir storage at the end of September. The following reservoirs were at their lowest end of September storage since; Enders Reservoir, 1978; Harlan County Lake, 1978; Swanson Lake, 1979; Hugh Butler Lake, 1980; Harry Strunk Lake, 1980; Kirwin Reservoir, 1980; Norton Reservoir, 1982; Lovewell Reservoir, 1982; and Webster Reservoir, 1983. The Republican River Basin reservoir storage was at its lowest level since 1978, and the combined reservoir storage in the Projects area was at its lowest level since 1980.

The following summarized graph shows a comparison of 1989 and 1990 carryover storage and total conservation storage for all reservoirs in the Niobrara. Lower Platte, and Kansas River Basins.

2. Flood Control Operations. The total 1990 flood control benefits accrued by the operation of the Nebraska-Kansas Projects dams was \$562,000. The accumulative total of flood control benefits for the years 1951 through 1990 by facilities in this report total \$76,809,000 (see table 5). To date no benefits have been accrued by the operation of Box Butte, Merritt, Sherman, or Virginia Smith Dams.

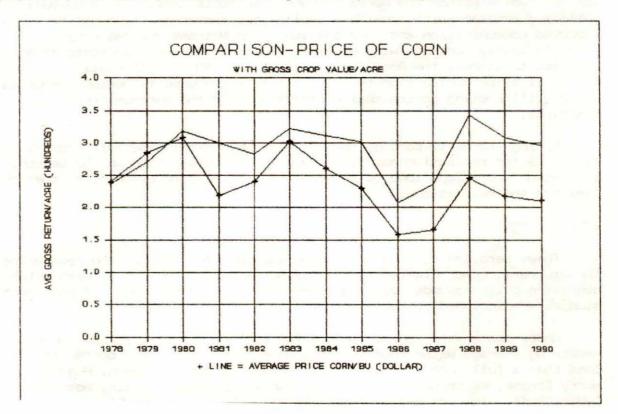

There were 460,532 acre-feet of water diverted to irrigate 251,597 acres of projects lands in 13 of the 14 irrigation districts (see tables 3 and 6). The project water supply was either inadequate or limited for 174,925 acres of the total project lands. This includes lands in Mirage Flats, Frenchman Valley, H&RW, Frenchman-Cambridge, Nebraska and Kansas Bostwick, Almena, Kirwin, Webster, and Cedar Bluff Irrigation Districts. No project water was available for delivery to Cedar Bluff Irrigation District. The project water supplies for the other units mentioned in this report were adequate in 1990.

The water requirements of three municipalities, one rural water district, and a fish hatchery facility were furnished from storage releases or natural flows.

Under a long-term contract with Reclamation for use of the Arcadia Diversion Dam, the Middle Loup Public Power and Irrigation District diverted 39,294 acre-feet to irrigate 14,252 acres of non-project lands. These diversions were made under natural-flow water rights granted by the state of Nebraska.

Irrigation Production

The 1990 crop yields from lands receiving project water exceeded or equalled those of 1989 for all districts except H&RW, Nebraska and Kansas Bostwick, and Farwell. Corn, the principal crop, increased from an average of 133 bushels per acre to 138 bushels per acre. Unit prices for grain and soybeans were slightly lower than those in 1989. The total gross crop value for districts receiving project water was \$74,537,664. The average gross crop value per acre decreased from \$307.87 to \$296.26 during 1990. The following graph compares corn prices with the gross crop value per acre.

The following summary shows the comparison of corn yields for each irrigation district.

	Corn Yiel	d (bu/acre)
Irrigation District	1989	1990
Mirage Flats	107	133
Ainsworth	111	144
Sargent	124	130
Farwell	139	132
Twin Loups	131	136
Frenchman Valley	152	154
H&FW	148	139
Frenchman-Cambridge	134	145
Almena	149	155
Bostwick in Nebraska	147	141
Kansas-Bostwick	159	139
Kirwin	128	133
Webster	103	113
Cedar Bluff	*	*
Average of Districts Reporting	133	138

*No project water supplied; not included in averages.

Fish and Wildlife and Recreation Benefits

The National Recreational Fisheries Policy declares that the Governments vested with stewardship responsibilities must work in concert with the state managing agencies recreational fisheries constituency and the general public to conserve, restore, and enhance recreational fisheries and their habitats. As a result of this policy, Reclamation has developed fishery management guidelines for reservoirs within the Nebraska-Kansas Projects area. These guidelines outline a program which considers public use, fisheries, fish habitat, and improved communication and coordination. The Nebraska-Kansas Projects Office conducts yearly meetings with Nebraska, Colorado, and Kansas state management agencies to discuss the Annual Operating Plans (AOP). Information is solicited that will allow Reclamation the flexibility to enhance fisheries resources while still meeting contractual obligations with the various irrigation districts.

During the early part of the 1990 season, normal reservoir operations were favorable for recreation and fish and wildlife uses. Late in the season, irrigation operations lowered reservoir levels at some reservoirs, thereby limiting the recreation benefits.

1991 Outlook

Three detailed studies have been developed for each of the reservoirs in the Niobrara, Lower Platte, and Kansas River Basins conforming with established operating criteria under various reservoir inflow conditions. These operation studies are included as table 4.

Under reasonable minimum inflow forecast conditions, irrigation districts receiving storage water from the following reservoirs are expected to receive less than a full supply: Box Butte, Sherman, Enders, Swanson, Hugh Butler, Harry Strunk, Keith Sebelius, Harlan County, Lovewell, Kirwin, Webster and Cedar Bluff. The irrigation districts affected are Mirage Flats; Sargent and Farwell; Frenchman Valley and H&RW; Frenchman-Cambridge; Almena; Nebraska and Kansas Bostwick; Kirwin and Webster; and Cedar Bluff, respectively. If 1991 is

a dry year, 211,700 of the total 266,700 acres estimated to be irrigated (79 percent) will have an inadequate water supply.

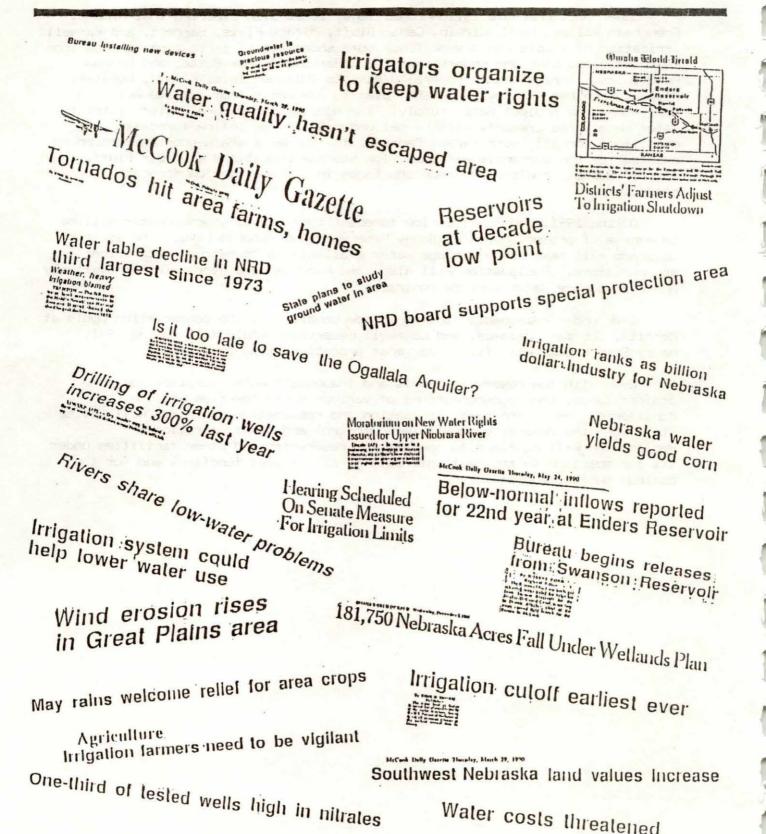

Under most probable inflow conditions, it is also expected that Almena, Frenchman Valley, H&RW, Kirwin, Cedar Bluff, Mirage Flats, Sargent, and Farwell Irrigation Districts would experience some shortages to irrigation demands from Keith Sebelius Lake and Enders, Kirwin, Cedar Bluff, Box Butte, and Sherman Reservoirs. Irrigators in several districts (Mirage Flats, Kirwin, Webster, Almena, Frenchman Valley, and H&RW) plan to use water from private wells to supplement the project water supply. The municipal and rural water district water supply requirements will be met under all three inflow forecast conditions for all units except Cedar Bluff. Under a share—shortage procedure adopted for the currently extremely low storage conditions at Cedar Bluff, the city of Russell could experience shortages in dry—year inflow forecast conditions.

During 1991, under all inflow forecast conditions, storage water will be in excess of project needs at Bonny Reservoir and Waconda Lake. The state of Colorado will make Bonny storage water available to downstream water right appropriators. Reclamation will also make Waconda Lake storage water available under temporary water service contracts.

Even under reasonable minimum inflow conditions, the conservation pools at Merritt, Sherman, Calamus, and Lovewell Reservoirs would fill during 1991. Harry Strunk Lake will fill under most probable inflow conditions.

Even with low reservoir levels and inadequate water supplies for some project lands, the recommendations of various state agencies will be considered. As in the past, irrigation and reclamation districts will advise state agencies regarding aquatic weed control and canal operations. Reclamation will continue to operate the reservoirs and other facilities under its jurisdiction in the best interests of all project functions and for the optimum public benefit.

HEADLINES '90

Water costs threatened

Purpose of This Report

This AOP advises water users, cooperating agencies, and other interested groups or persons of the actual operations during 1990 and serves as a guideline for the 1991 operations. This report also describes the responsibilities of Reclamation, Corps of Engineers, and the irrigation and reclamation districts in the Niobrara, Lower Platte, and Kansas River Basins.

Operational Responsibilities

Reclamation is responsible for irrigation operations at all federal reservoirs in the Nebraska-Kansas Projects area. Reclamation is also responsible for the operation and maintenance (O&M), safety of the structure, and reservoir operations not specifically associated with regulation of the flood control storage at the reservoirs constructed by Reclamation. In addition to irrigation and flood control, these reservoirs provide recreation, fish and wildlife, and municipal benefits.

By contractual arrangements with Reclamation, the irrigation or reclamation districts in the Niobrara, Lower Platte, and Kansas River Basins are responsible for the O&M of the canals and irrigation distribution facilities constructed or rehabilitated by Reclamation. In addition, the appropriate irrigation or reclamation districts are responsible for operating and maintaining Box Butte, Merritt, and Sherman Dams and Reservoirs. The Corps of Engineers operates and maintains Harlan County Dam and Lake. The state of Colorado provides operational guidelines for Bonny Reservoir. Reclamation operates and maintains 12 dams and reservoirs in the Lower Platte, Republican, Solomon, and Smoky Hill River Basins. A three year contract, which became effective July 1, 1988, provides for Kirwin Irrigation District to perform certain operational and maintenance functions at Kirwin Dam. Under a contract with Reclamation, the Twin Loups Reclamation District will operate and maintain Virginia Smith and Davis Creek Dams during 1991.

The states of Nebraska, Colorado, and Kansas are responsible for the administration and enforcement of their state laws pertaining to the water rights and priorities of all parties concerned with the use of water. The states are also responsible for administering the water surface activities and the federal lands around the reservoir.

Reclamation cooperates with all state agencies and compact commissions to ensure that all operations are in compliance with state laws and compact requirements.

Tables and Exhibits

Records for the facilities reported in the AOP are included as tables and exhibits and are located in the appendix.

Water Supply

For forecasting purposes, values of annual inflows that will be statistically equalled or exceeded 10, 50, and 90 percent of the time were selected from the probability data to be reasonable maximum (wet year), most probable (normal year), and reasonable minimum (dry year) inflow conditions, respectively.

Inflow records from 1965 through 1990 were used for the analysis of those reservoirs in the Kansas River Basin. Inflow records from 1967 through 1990 were used for the analysis of the reservoirs located in the Niobrara and Lower Platte Basins, except for Calamus Reservoir where the more recent record of 1986 through 1990 was used.

Reservoir Operations

All operations are scheduled for optimum benefits of the authorized project functions. Monthly, or as often as runoff and weather conditions dictate, Reclamation evaluates the carryover storage and estimated inflow at each reservoir to determine whether excess water is anticipated. If excess inflow is apparent, controlled releases will be made to maximize the downstream benefits, including flood control.

Major Features

The Mirage Flats Project was constructed under the Water Conservation and Utilization Act and includes an irrigation storage reservoir, diversion dam, and canal system. The other features discussed in this report are a part of the Pick-Sloan Missouri Basin Program and include multipurpose reservoirs, diversion dams, pump stations, and canal systems. The 17 storage facilities now in operation are listed below.

Constructed by Reclamation

- 1. Operated by irrigation or reclamation districts—Box Butte and Merritt Dams in the Niobrara River Basin and Sherman Dam in the Lower Platte River Basin. Under a contract with Reclamation, the Twin Loups Reclamation District will operate and maintain Virginia Smith and Davis Creek Dams during 1991. Following completion of the North Loup Project distribution works the responsibility for the operation and maintenance of Virginia Smith Dam and Davis Creek Dam will be transferred to the district.
- 2. Operated by Reclamation—Bonny, Trenton, Enders, Red Willow, Medicine Creek, Norton, Lovewell, Kirwin, Webster, Glen Elder, and Cedar Bluff Dams in the Kansas River Basin. A contract provides for Kirwin Irrigation District to perform certain operational and maintenance functions at Kirwin Dam.

Constructed and Operated by the Corps of Engineers

1. Harlan County Dam in the Kansas River Basin.

Irrigation and Reclamation Districts

Fourteen irrigation districts and two reclamation districts in the Niobrara, Lower Platte, and Kansas River Basins have contracted with Reclamation for water supply and irrigation facilities. The Sargent and Farwell Irrigation Districts have contracted their O&M responsibilities to the Loup Basin Reclamation District. The Twin Loups Irrigation District has contracted their O&M responsibilities to the Twin Loups Reclamation District.

The contracted irrigation season for the Mirage Flats Irrigation District is April through September. The contracted irrigation season for Frenchman Valley, H&RW, Frenchman-Cambridge, and Cedar Bluff Irrigation Districts is from May 1 through October 15. The contracted irrigation season for Twin Loups Reclamation District is May 1 through September 30 or such additional period from April 1 through November 15 of each year as determined between the District and Reclamation. For all other districts, the contracted irrigation season is from May 1 through September 30.

Municipal Water

Three municipalities and one rural water district have executed water service contracts for full or supplemental water supplies.

Fish and Wildlife

The state of Kansas is presently using the fish hatchery facility below Cedar Bluff Reservoir. Construction of the Calamus Fish Hatchery continues to make good progress with Phase II work nearly complete and over half of the Phase III work completed. Operation of this fish hatchery is scheduled to begin this year.

State of Colorado Division of Wildlife

The Division of Wildlife provides operational guidelines for Bonny Reservoir. The entire conservation pool storage was purchased by the state of Colorado on June 24, 1982.

Power Interference Considerations

A Power Interference Agreement exists between Reclamation, the Twin Loups Reclamation District, and the Loup River Public Power District. Provisions of this agreement will be incorporated into the 1991 operations.

Environmental Considerations

A "Statement of Operational Objectives" for Harlan County Lake sets forth the general operational objectives and the specific reservoir uses that are desirable. The operational objectives indicate that fish and wildlife interests are best served by high reservoir levels with minimum fluctuations and regulation of the outflow in excess of the minimum desired flows. Although the statement recognizes flood control and irrigation as primary purposes, it indicates that comprehensive operational plans should be developed for maximum integration of the secondary uses.

These objectives are also considered in the operation of all reservoirs in the Kansas River Basin, Merritt and Box Butte Reservoirs in the Niobrara River Basin, and Sherman, Calamus and Davis Creek Reservoirs in the Lower Platte River Basin. The regulated outflow will also benefit farmers, ranchers, cities, and other interests below the reservoirs.

Mirage Flats Project in Nebraska

General

The flow of the Niobrara River and Box Butte Reservoir storage provide a water supply for the 11,662-acre Mirage Flats Project. From 1981 to 1990, the project water supply averaged 14,646 acre-feet, which is about 1.26 acre-foot per irrigable acre. This amount is 1.06 acre-foot per acre short of the average diversion requirement of 2.32 acre-feet per acre. The March 1965 report on the project estimated this amount to be necessary for a full water supply. Many irrigators supplement their water supply by private wells.

The Mirage Flats Irrigation District cooperates with the Nebraska Game and Parks Commission by operating the Box Butte Dam outlet works gates and the Dunlap Diversion Dam gates in a manner to avoid sudden large changes in the flows of the Niobrara River.

1990 Summary

The flows of the Niobrara River plus the carryover storage in Box Butte Reservoir were not adequate to provide a full water supply for the project lands. The total precipitation in the Mirage Flats area was 15.16 inches, which is 97 percent of normal. The total inflow (15,124 acre-feet) was below the dry-year forecast.

From July through August, diversions of 8,662 acre-feet to the Mirage Flats Canal provided irrigation water for 9,875 acres, 85 percent of the service available acreage. The farm deliveries from the project water supply were 2,967 acre-feet (0.25 acre-foot per irrigable acre), which is a delivery efficiency of 34 percent. The reservoir contained only 3,947 acre-feet of water at the end of the irrigation season. Privately owned irrigation wells supplemented the project water supply. The gross crop value was \$2,795,567 which is \$572,379 less than the 1989 value.

1991 Outlook

The project water supply is expected to be inadequate in 1991 like it has been since the early 1960's. In the spring, the district will announce to their water users the amount of water that will be available from storage in Box Butte Reservoir. However, the district plans for the irrigators to continue the use of water from privately owned irrigation wells as a supplemental supply. In 1991, 10,900 acres are expected to be irrigated.

An agreement has been made between the district and the Nebraska Game and Parks Commission whereby the district will not draw the reservoir water level below elevation 3978.00 feet. In return the district received an upfront payment which is being used to improve the efficiency of the project's delivery system.

Ainsworth Unit, Sandhills Division in Nebraska

General

Within the Ainsworth Irrigation District, there are 34,539 acres with service available. The project water supply is provided by storage of Snake River flows in Merritt Reservoir. The reservoir is filled each fall after the irrigation season to elevation 2944.0 feet. This level is approximately 2 feet below the top of conservation capacity. The reservoir is regulated to maintain this level until the ice clears each spring. Upon ice-out the outlet pipe is drained, inspected, and repaired as necessary. The reservoir will then be rapidly filled to elevation 2945.00 feet to reduce shoreline erosion around the reservoir and minimize sand accumulations on the dam. This reservoir level is maintained until May at which time the reservoir is slowly filled. A minimum release of 75 cfs will be made to the river during spring filling operations. This operation also enhances the spring fish spawn. Seepage, pickup and toe drain flow normally result in flows of up to 15 cubic feet per second below Merritt Dam. Whenever possible, daily changes in releases to the river should be made in no more than 50 cubic feet per second increments. This will minimize adverse impacts on the Snake River trout fishery downstream of the dam.

The basic water supply for the district is 63,712 acre-feet. If available, additional water can be purchased by the district as a supplemental supply.

1990 Summary

Precipitation, as recorded near Merritt Dam, totaled 18.80 inches of rainfall, which was 97 percent of normal. The water supply was more than adequate to meet the project's irrigation requirement. There were 68,286 acrefeet diverted from Merritt Reservoir into the Ainsworth Canal, with 44,091 acrefeet delivered to the farm headgates (delivery efficiency of 65 percent). There were 33,542 acres of land irrigated in 1990. The gross crop value was \$12,283,862, which is \$622,761 more than the previous year.

The district executed several temporary water service contracts which provided a total of 108.22 acre-feet of irrigation water from holding ponds located within the district's service area.

1991 Outlook

In 1990-91 winter months and future years, the reservoir will be regulated to maintain elevation 2944.0 feet (2.0 feet below the top of conservation capacity). This elevation is within the repaired area of soil cement on the upstream face of the dam. Holding the reservoir at this elevation during the winter will help avoid ice damage to the older existing soil cement at lower elevations.

In order to alleviate erosive action to the lands around the reservoir and to maximize all benefits associated with the reservoir, releases from Merritt Reservoir will be regulated to fill the conservation capacity in two stages during the spring months. As is the normal practice after ice—out in the spring, the outlet pipe will be drained, inspected, and repaired as necessary. Once inspections and repairs have been made the reservoir will be rapidly

filled to elevation 2945.00 feet. A minimum river release of 75 cfs will be made during this filling operation. The reservoir level will be maintained through the end of April and then slowly filled to the top of conservation pool by late May. If weather conditions or irrigation demands dictate, it may be necessary to begin filling the reservoir prior to this time. The water supply is expected to be adequate in 1991 for the irrigation of 34,000 acres.

Sargent Unit, Middle Loup Division in Nebraska

General

The Sargent Irrigation District has contracted with the Loup Basin Reclamation District for the O&M of the Milburn Diversion Dam and the Sargent Canal system which serves 13,922 acres. The water supply is diverted from the Middle Loup River into the Sargent Canal under an appropriated natural-flow water right from the state of Nebraska. These diversions may exceed the natural-flow water appropriation of 202 cubic feet per second by an exchange of storage from Sherman Reservoir, provided that water is available after all senior appropriations are satisfied, and the excess is not greater than the compensating storage releases from Sherman Reservoir.

1990 Summary

The precipitation over the Sargent Unit (19.58 inches at district headquarters) was 84 percent of normal. The irrigation diversions into the Sargent Canal totaled 27,351 acre-feet (17,717 acre-feet were delivered to the farm headgates—delivery efficiency 65 percent). The diversions exceeded the direct-flow water right for 20 days. There were 13,235 acres irrigated, and the gross crop value totaled \$3,211,746, which is \$28,637 less than in 1989. The irrigators grow corn as the principal crop, creating very high water demands in July and August. The demands cannot be met within canal capacity, so the district institutes a rationing process through the peak period, when necessary.

1991 Outlook

The Loup Basin Reclamation District estimates that 13,000 acres in the Sargent Unit will be irrigated in 1991. Under normal— and dry-year conditions, some shortages could occur. The Farwell and Sargent Irrigation Districts are required to share shortages in accordance with their contract.

Farwell Unit, Middle Loup Division in Nebraska

General

The Loup Basin Reclamation District operates and maintains the Arcadia Diversion Dam, Sherman Feeder Canal, Sherman Dam and Reservoir, and the Farwell Canal system, which serves 50,051 acres of land. Diversions are also made through the Arcadia Diversion Dam to 15,000 acres of non-project lands in the Middle Loup Public Power and Irrigation District under their appropriated natural-flow water rights.

Middle Loup Public Power and Irrigation District, Loup Basin Reclamation District, Farwell Irrigation District and Sargent Irrigation District have executed an agreement to temporarily cease diversions when conservation storage space in Sherman Reservoir has been evacuated. The agreement was executed December 10, 1984.

During the winter months, Sherman Reservoir is normally regulated to 5 feet or more below the top of the conservation capacity. Doing so minimizes seepage from the reservoir into the groundwater table. Maintenance of the pool below the top of conservation provides time for seeding of exposed shore areas to prevent wind erosion. The seedings also provide winter food and cover for wildlife and spawning habitat for fish in the spring when these areas are inundated. Each spring, diversions into Sherman Feeder Canal from the Middle Loup River are regulated to fill the conservation capacity of Sherman Reservoir by late May. The gradually rising water surface in the spring is desirable for fish spawning.

Whenever the flows in the Middle Loup River at Arcadia, Nebraska, exceed 6,000 cubic feet per second, flows will be diverted through Sherman Feeder Canal into Sherman Reservoir. Flood control benefits can be accrued to Sherman Reservoir by such operations.

1990 Summary

The diversions from the Middle Loup River at Arcadia Diversion Dam were 39,294 acre-feet to the Middle Loup Public Power and Irrigation District and 99,974 acre-feet into the Sherman Feeder Canal. During the fall of 1985 the Middle Loup Public Power and Irrigation District constructed a turnout in the Sherman Feeder Canal near mile post 11.4. The turnout diverts water directly to the Number 4 Canal. Releases to the turnout amounted to 1,396 acre-feet and the losses charged as a result of these deliveries totaled 140 acre-feet.

Sherman Feeder Canal diversions into Sherman Reservoir were started on April 12, and the conservation capacity was filled on May 22. The precipitation at Sherman Dam was 22.32 inches, which is 102 percent of normal. Releases into the Farwell Canals totaled 77,011 acre-feet (46,009 acre-feet were delivered to the farm headgates—delivery efficiency 60 percent). The Farwell Irrigation District reported that 44,975 acres of land were irrigated in 1990. The gross crop value was \$12,405,562, which is \$1,405,831 less than in 1989. Sherman Feeder Canal was shut off October 11.

Under an ongoing program the Farwell Irrigation District has installed a total of about 111 miles of pipe to replace open laterals.

1991 Outlook

Diversions from the Middle Loup River into the Sherman Feeder Canal are expected to start in the spring for the normal filling of the conservation capacity of Sherman Reservoir prior to the irrigation season.

Under normal- and dry-year inflow conditions, irrigation shortages are expected in 1991. These shortages are attributable to large irrigation requirements for corn production during the months of July and August. Farwell and Sargent Irrigation Districts are required to share shortages in accordance with their contract.

North Loup Division in Nebraska

General

The North Loup Division is located in the Loup River drainage basin. When completed, water will be diverted from the Calamus and North Loup Rivers. The plan provides for direct surface water service to 53,000 acres of project lands. Operation of the division will also provide a sustained groundwater supply for an additional 17,000 acres. Principal features of the division will include Virginia Smith Dam and Calamus Reservoir, Kent Diversion Dam, Davis Creek Dam and Reservoir, five principal canals, one major and one small pumping plant and numerous laterals.

Calamus Reservoir is normally regulated at 3 to 4 feet below the top of conservation capacity during the winter months. Holding the reservoir at this elevation during the winter will help avoid ice damage to the soil cement on the upstream face of the dam. After the ice clears in the spring, the reservoir will be regulated to slowly fill to conservation capacity. This operation enhances the spring fish spawn. During the months of July, August, and September, inflows to the reservoir are required to be bypassed under the Power Interference Agreement between Reclamation, the Twin Loups Reclamation District, and the Loup River Public Power District.

Davis Creek Dam was completed in the fall of 1990 with the first stage of reservoir filling scheduled to begin this spring.

1990 Summary

Precipitation at Virginia Smith Dam was 22.33 inches which is 99 percent of normal. The inflow was 227,814 acre-feet which was between the normal—and wet—year forecasts. There were 29,148 acre-feet diverted from Calamus Reservoir into the Mirdan Canal, with 16,537 acre-feet delivered to the farm headgates. Land irrigated in 1990 totaled 17,768 acres. The gross crop value was \$4,597,207 which is \$759,105 more than the 1989 value. As required, bypasses of the inflows were made during July, August, and September.

1991 Outlook

The reservoir water surface will be held at the present elevation of approximately 2240.00 feet until ice-out, at which time the reservoir will be rapidly filled to an elevation of 2243.50 feet (6 inches below the top of conservation capacity). This reservoir level will be maintained in order to minimize shureline erosion until demands begin to draw on the reservoir. Bypasses of inflows will be made during July, August and September. In the fall the reservoir will be filled to about elevation 2240.00 feet.

Water has been declared available to serve all irrigable acres with service from the Mirdan, Geranium and Scotia Canals and Lateral Systems. It is estimated that approximately 21,000 acres will be irrigated from Mirdan, Geranium, and Scotia Canals. Water supplies will be sufficient to meet the full dry-year requirements.

Spring releases will be made to initiate filling of Davis Creek Reservoir to elevation 2035. This elevation will be maintained until surfacing of the relocated county road is completed.

The fish hatchery is expected to begin operations this year.

Armel Unit, Upper Republican Division in Colorado

General

Normal reservoir operations for Bonny Reservoir are primarily for recreation and fish and wildlife support, although water will be available for water right administration and irrigation purposes.

Bonny Reservoir inflows from the South Fork of the Republican River and Landsman Creek are released into Hale Ditch as requested by the Colorado State Engineer. The state will make Bonny storage water available to Hale Ditch and other natural flow appropriators under short-term water service contracts. Most of the 700 acres served by Hale Ditch are now owned and operated by the Division of Wildlife, Colorado Department of Natural Resources.

The normal operation pattern of Bonny Reservoir, with a slowly rising or stable pool, enhances fish spawning in the spring and provides excellent hunting conditions each fall.

1990 Summary

The 18.00 inches of precipitation during 1990 was 109 percent of normal. The inflow (14,135 acre-feet) to Bonny Reservoir was below the dry-year forecast. As directed by the Colorado Water Commissioner, 525 acre-feet of reservoir inflows from the South Fork of the Republican River and Landsman Creek were passed through Bonny Reservoir into Hale Ditch. In addition, the Colorado Department of Natural Resources requested storage releases of 1,925 acre-feet for irrigation purposes into Hale Ditch.

1991 Outlook

Water stored in Bonny Reservoir will be available for sale to Hale Ditch and other private irrigators under short-term water service contracts executed with the state.

Inflows will be stored during the winter until filling of the conservation pool is certain. Releases can be made during this period to maintain a constant reservoir elevation when filling of the reservoir is imminent or if icing were to become a problem.

Frenchman Unit, Frenchman-Cambridge Division in Nebraska

General

The Culbertson Canal and the Culbertson Extension Canal systems serve 9,600 acres in the Frenchman Valley Irrigation District and 11,490 acres in the H&RW Irrigation District. The water supply for these lands is furnished by flows from Frenchman and Stinking Water Creeks and off-season storage in Enders Reservoir.

The normal operation of Enders Reservoir, with the gradual rise in water surface during the spring months, provides desirable fish spawning conditions. Irrigation releases will normally deplete the conservation storage by late summer, thereby limiting the fishing and recreational usage.

1990 Summary

The 17.67 inches of precipitation at Enders Dam was 96 percent of normal. The 1990 inflow into Enders Reservoir (19,308 acre-feet) was below the dry-year forecast. Due to extensive groundwater pumping above the reservoir, the inflow was only 32 percent of the average historical preconstruction runoff at the Enders dam site (60,700 acre-feet from 1929-1947). This year was the twenty-third consecutive year with below-normal inflows in which the conservation pool did not fill. A total of 2,747 acre-feet of water was conserved between the 1989 and 1990 irrigation seasons by pumping seepage back into the reservoir. Irrigation releases began June 16 and were stopped on August 5.

The farm delivery averaged about 0.54 feet per irrigated acre for the two districts. Some farmers were able to supplement their project water supply from private irrigation wells. The Frenchman Valley Irrigation District reports that 8,048 acres received water in 1990, and the H&RW Irrigation District reports 10,604 acres, which are 84 and 92 percent, respectively, of the lands with service available. The gross crop value for Frenchman Valley Irrigation District was \$2,512,083 which is a decrease of \$136,606 from the previous year. The gross crop value for the H&RW Irrigation District was \$2,936,144, which is a decrease of \$216,919 from the previous year.

1991 Outlook

The fall and early winter inflows into Enders Reservoir were below the dry-year forecast. If reasonable minimum inflow conditions prevail, the project water supply is expected to experience a shortage of about 30,300 acre feet. Most probable inflow conditions are expected to be inadequate by 3,700 acrefeet, to irrigate the 7,800 acres in the Frenchman Valley Irrigation District and 10,000 acres in the H&RW Irrigation District. Approximately 3,000 acrefeet are expected to be conserved by pumping seepage water back into the Enders Reservoir.

Meeker-Driftwood, Red Willow, and Cambridge Units, Frenchman-Cambridge Division in Nebraska

General

During the spring months, Swanson, Hugh Butler, and Harry Strunk Lakes normally have a rising or stable pool which enhances the spawning of northern pike and walleye. These lakes provide excellent opportunities for fishing, water sports, and recreation.

Service is provided for Frenchman-Cambridge Irrigation District by Meeker-Driftwood Canal to 16,476 acres; Red Willow Canal to 4,932 acres; Bartley Canal to 6,539 acres; and Cambridge Canal to 17,053 acres. The water supply for these lands is provided by storage in Swanson, Hugh Butler, and Harry Strunk Lakes, and inflows of the Republican River and Red Willow and Medicine Creeks.

1990 Summary

The precipitation of 17.26 inches at Trenton Dam was 88 percent of normal. The inflow of 46,738 acre-feet to Swanson Lake was below the dry-year forecast. The reservoir's conservation pool did not fill in 1990, with the maximum water surface elevation of 2747.65 feet reached on June 11. At the beginning of the 1990 irrigation season (June 18), there was 91,886 acre-feet of water stored in Swanson Lake, which is 20,328 acre-feet below the top of conservation capacity. This storage, along with inflows and river pickup flows was sufficient in furnishing a limited water supply to each irrigable acre of the project lands served by the Meeker-Driftwood and Bartley Canal systems. The Frenchman-Cambridge Irrigation District diverted 32,301 acre-feet into Meeker-Driftwood Canal to irrigate 15,193 acres and 9,478 acre-feet into Bartley Canal for 6,012 acres.

The precipitation of 16.44 inches at Red Willow Dam was 84 percent of normal, while the inflow of 14,056 acre-feet into Hugh Butler Lake was below the dry-year forecast. The reservoir's maximum water surface elevation for the year was 2577.66 feet, reached on June 9 (4.14 feet below top of conservation). The water supply was adequate to meet the limited supply designated for Red Willow Canal. The district diverted 8,803 acre-feet of water to irrigate 4,569 acres of land served by Red Willow Canal.

The precipitation of 18.84 inches was 92 percent of normal at Medicine Creek Dam, while the inflow of 30,144 acre-feet was below the dry-year forecast. The reservoir's conservation pool was filled on May 6 with the maximum water surface elevation for the year of 2367.15 feet reached on June 5. Releases were made during April to defer flows from overtopping the uncontrolled spillway until after the walleye spawning period. These releases were made in cooperation with the Nebraska Game and Parks Commission. The water supply was adequate for the limited supply and 28,378 acre-feet of water was diverted to irrigate 15,808 acres of land served by the Cambridge Canal.

The 1990 gross crop value from the lands served by Meeker-Driftwood, Bartley, Red Willow, and Cambridge Canals was \$12,938,194, which is \$1,171,223 more than in 1989.

1991 Outlook

Forecasts show that carryover storage, streamflow gains, plus reasonable minimum inflows for the three lakes supplying the Frenchman-Cambridge Irrigation District will be inadequate to meet the full dry-year irrigation requirement. In an effort to conserve water, the District management has elected to operate with a limited water supply to each irrigable acre.

It is estimated that 14,900 acres will be served from the Meeker-Driftwood Canal; 16,400 acres will be served from the Cambridge Canal; 4,700 acres will be served from the Red Willow Canal; and 5,900 acres will be served from the Bartley Canal.

Almena Unit, Kanaska Division in Kansas

General

Service is available to 5,763 acres in the Almena Irrigation District. The project water supply is provided by Prairie Dog Creek flows and Keith Sebelius Lake storage.

The water service contract for the city of Norton, Kansas, provides for a maximum annual use of 1,600 acre-feet from Keith Sebelius Lake.

1990 Summary

The precipitation at Norton Dam was 21.76 inches, which is 91 percent of normal. The total inflow was 3,979 acre-feet, which was between dry- and normal-year forecasts. Farm delivery averaged about 0.23 acre-foot per irrigated acre from the project water supply. The remaining demands were supplied from privately owned irrigation wells for the twentieth consecutive year. The 5,145 acres irrigated in 1990 produced a gross crop value of \$1,769,900, which is \$119,577 more than in 1989.

The city of Norton used 503 acre-feet of municipal water during 1990.

The maximum content of Keith Sebelius Lake for the year was 7,657 acrefeet, which was reached on June 12, 1990. At the end of irrigation season (July 17) approximately 382 acre-feet was still available for release.

1991 Outlook

The district expects to deliver water to 5,200 acres if an adequate water supply is available. If 1991 is a dry year without significant run-off producing storms above Keith Sebelius Lake, it is anticipated that significant irrigation shortages of 17,400 acre-feet would occur. If normal inflow into the lake and normal rainfall over the irrigated area occur in 1991, a shortage of 8,300 acre-feet may be experienced.

Requirements for the city of Norton are expected to be met in full in 1991.

Franklin, Superior-Courtland, and Courtland Units, Bostwick Division in Nebraska and Kansas

General

Harlan County Lake storage and Republican River flows provide a project water supply for 22,787 acres in the Bostwick Irrigation District in Nebraska, and 13,550 acres in the Kansas-Bostwick Irrigation District No. 2 above Lovewell Reservoir. These flows, together with White Rock Creek flows and Lovewell Reservoir storage, furnish a water supply for 28,338 acres below Lovewell Reservoir in the Kansas-Bostwick Irrigation District.

The lands in the Franklin and Superior-Courtland Units are in the Bostwick Irrigation District in Nebraska. The lands in the Courtland Unit are in the Kansas-Bostwick Irrigation District.

In accordance with the off-season flow alternative outlined in Reclamation's final environmental assessment dated December 16, 1983, releases will be 10 cubic feet per second during the months of December, January, and February, except when the reservoir is at low levels. During water-short years releases for these three months will be 5 cubic feet per second or zero. At the request of the state of Nebraska, releases of 30 cubic feet per second for a maximum 5-day period may be made to relieve icing conditions in the river.

Natural gain in streamflow, plus irrigation return flows, and operational bypass at Superior-Courtland Diversion Dam will provide some flow downstream.

The Kansas Department of Wildlife and Parks has requested that the Kansas-Bostwick Irrigation District and Reclamation maintain, when possible, a flow of 20 cubic feet per second into Lovewell Reservoir when the Courtland Canal is in operation and the conservation pool is below capacity. This recommended inflow provides excellent fishing around the canal inlet to the reservoir. The seepage below Lovewell Dam into White Rock Creek maintains a small live stream throughout the year.

Following a survey of the sediment ranges in 1988, Harlan County Lake areacapacity data was revised and the new data placed in use January 1, 1990.

1990 Summary - Bostwick Division - Harlan County Lake Operations

The precipitation at Harlan County Dam totaled 21.62 inches of rainfall, which is 97 percent of normal. The inflow (92,191 acre-feet) was below the dry-year forecast. No release was required during January, February, or December in accordance to the environmental assessment and the annual operating plan because of the low reservoir level. The highest water surface elevation for the year was 1941.02 feet which was reached on June 22 (4.98 feet below the top of conservation). At the end of irrigation season (September 13) 177,074 acre-feet of storage remained in Harlan County Lake.

The 30,584 irrigated acres of the Bostwick District in Nebraska and the Kansas-Bostwick District above Lovewell Dam could not be furnished a full water supply so the irrigators operated with a limited supply. A total of 48,654 acre-feet (approximately 73 percent of total inflow) were delivered to Lovewell Reservoir through the Courtland Canal.

1990 Summary - Bostwick Division - Nebraska

The Bostwick Irrigation District in Nebraska diverted 41,837 acre-feet for the irrigation of 18,724 acres. The gross crop value was \$6,042,805, which is \$73,565 less than in 1989.

1990 Summary - Bostwick Division - Kansas

The 1990 precipitation at Lovewell Dam totaled 23.26 inches, which was 82 percent of normal. The reservoir's conservation space filled on May 13. A flood release was not required as releases for large irrigation demands dropped the reservoir from the flood pool. The maximum elevation of the water surface was 1584.69 feet, which was reached on June 22. Anticipating the possibility of water shortages in 1991, natural flow from the Republican River was diverted into Lovewell Reservoir through Courtland Canal from the end of irrigation season until December 19.

The Kansas-Bostwick Irrigation District diverted a total of 80,909 acrefeet to serve 11,860 acres above Lovewell Dam and 24,805 acres below Lovewell Dam. Irrigators operated with a limited supply since a full water supply could not be furnished to these acreages. The gross crop value was \$10,399,998, which is \$1,039,459 less than the previous year.

1991 Outlook - Bostwick Division

The Bostwick Irrigation District in Nebraska and the Kansas-Bostwick Irrigation District No. 2 expect to deliver water to 20,600 and 38,000 acres, respectively. The storage in Harlan County Lake and Lovewell Reservoir and flows of the Republican River and White Rock Creek will be inadequate to meet the full dry-year irrigation requirement for the Bostwick lands. In an effort to conserve water, the District management has again elected to operate with a limited water supply to each irrigable acre.

Inflow to Lovewell Reservoir from the Courtland Canal will start as necessary to allow for filling the reservoir from natural flow in the Republican River without storage releases from Harlan County Lake.

CHAPTER IV - SMOKY HILL RIVER BASIN

Kirwin Unit, Solomon Division in Kansas

General

The water supply for the 11,435 acres of land in the Kirwin Irrigation District is furnished by storage from Kirwin Reservoir and inflows from the North Fork of the Solomon River and Bow Creek.

The operation of Kirwin Dam and Reservoir affords many opportunities for recreation, fishing, hunting, water sports, fish spawning, and preservation of waterfowl species.

1990 Summary

The precipitation totaled 25.60 inches, which was 111 percent of normal. The inflow (12,320 acre-feet) was between the dry- and normal-year forecasts. Kirwin Canal was operated from June 26 until August 16. The district diverted 13,855 acre-feet for irrigation of 6,994 acres. Irrigators in the district continued to pump water from private wells to supplement irrigation of project lands. The district reported a gross crop value of \$1,665,663, which is an \$80,350 increase from the previous year.

1991 Outlook

The district estimates that 7,000 acres may be irrigated in 1991. Normal precipitation and normal forecasted inflows from the North Fork of the Solomon River would be inadequate to irrigate these lands. A shortage of 2,500 acrefeet may be experienced with normal-year forecasts. Under dry-year forecasts, a shortage of about 18,700 acre-feet may be experienced.

Webster Unit, Solomon Division in Kansas

General

The Webster Irrigation District has service available to 8,500 acres. The project water supply is provided by Webster Reservoir storage and flows of the South Fork of the Solomon River.

1990 Summary

In 1990, the precipitation at Webster Dam was 117 percent of normal (26.70 inches). The inflow of 12,099 acre-feet was between the dry- and normal-year forecasts.

The district diverted 9,070 acre-feet for irrigation of 4,440 acres. Irrigators with private wells provided water for part of the project lands as a supplemental supply. The district reported a gross crop value of \$978,933, which is \$173,133 more than the previous year.

1991 Outlook

The carryover storage and the flows in the South Fork of the Solomon River are expected to be adequate under normal- or wet-year forecasts to irrigate 4,500 acres in the district in 1991. However, if dry-year inflows continue a shortage of 15,000 acre-feet may be experienced.

Glen Elder Unit, Solomon Division in Kansas

General

Releases from Waconda Lake will be regulated as outlined in two memorandums of understanding between the state of Kansas and Reclamation. Releases are made for the city of Beloit, temporary short-term water service contracts, and water right administration. The water service contract with Beloit, Kansas, provides for the annual use of up to 2,000 acre-feet of Waconda Lake storage. Water is measured at the Glen Elder Dam river outlet works. In any water year that the city's water supply is insufficient and there is surplus water in Waconda Lake, such additional water may be released for the city at a rate of \$15.00 per acre-foot.

The water service contract with the Mitchell County Rural Water District No. 2 provides for use of storage water as available from Waconda Lake. Water usage is not to exceed 1,009 acre-feet per calendar year.

To lessen ice damage to the upstream face of Glen Elder Dam during winter months, releases from Waconda Lake will be regulated each year to maintain a constant water surface level while the lake is ice-covered. This level will be varied from 0 to 5 feet below the top of conservation capacity.

The available facilities along the shores of Waconda Lake and the large water surface area afford opportunities to thousands of people for picnics, sightseeing, recreation, water sports, hunting, and fishing.

When compatible with flood control operations, the operating criteria for Waconda Lake provide for a stable or rising pool level during the fish spawning period each spring.

When possible, drawdowns will be scheduled for late summer and early fall so that exposed shore areas can be seeded. This seeding prevents wind erosion and provides winter food and cover for wildlife and fish with spawning habitat in the spring when these areas are inundated.

1990 Summary

The precipitation at Glen Elder Dam was 105 percent of normal (26.27 inches). The inflow (100,728 acre-feet) was between dry- and normal-year forecasts. Storage releases of 75 acre-feet were made for the City of Beloit and 1,099 acre-feet was bypassed for quality control as directed by the State Water Commissioner. Other controlled releases were 54,872 acre-feet. This amount includes 1,296 acre-feet purchased by irrigators under temporary contracts. Releases of 651 acre-feet were made to the Mitchell County Rural Water District No. 2.

1991 Outlook

The municipal requirement of Beloit and the requirements of the Mitchell County Rural Water District No. 2 will be met in full with releases as required from Waconda Lake. It is expected that a Kansas Water Commissioner will request that inflows be passed through the lake for water right administration. Waconda Lake storage water will be available to natural flow appropriators under short-term water service contracts. To minimize ice damage, the reservoir will be regulated to maintain a constant level during the months the reservoir is ice-covered. Waconda Lake will be operated with a stable or slowly rising pool early in the year and refilled with available inflows starting in late spring of 1991. Under normal-year conditions, the lake will be maintained at about 3.0 feet below the top of the conservation pool for next winter.

Cedar Bluff Unit, Smoky Hill Division in Kansas

General

Cedar Bluff Reservoir storage and Smoky Hill River Flows provide a water supply for the 6,800 acres in the Cedar Bluff Irrigation District. If required Cedar Bluff storage also furnishes a maximum of 2,000 acre-feet each year for the city of Russell, Kansas. No water has been available for delivery to the district since 1978.

Following several years of below-normal inflows, a share-shortage procedure was adopted July 31, 1981. Separate pools were established for each user with inflow, outflow, and evaporation allocated on a monthly basis. Inflow and initial pool allocations were made on the basis of perfected maximum annual usage with the maximum accumulated storage being that allowed by each user's water right.

A memorandum of understanding between Reclamation, Fish and Wildlife Service, the State of Kansas and Cedar Bluff Irrigation District No. 6 concerning the reformulation and operation of the Cedar Bluff Unit was executed on December 17, 1987. Implementation of the memorandum of understanding awaits appropriate legislative action by the Congress.

1990 Summary

The precipitation was 26.48 inches which is 129 percent of normal. The inflow (3,653 acre-feet) was below the dry-year forecast. This year's high content of 18,964 acre-feet was reached on May 28 and was 16,356 acre-feet below the bottom of active storage. Due to continuing low water levels, no irrigation releases were made in 1990 (twelfth consecutive year). The state of Kansas used the fish hatchery facility with 67 acre-feet released to the facility. No releases were made for the city of Russell.

1991 Outlook

The reservoir elevation of 2096.69 feet on December 31, 1990, remains in the inactive pool. With dry-and normal-year inflows, the total irrigation demand of 21,000 and 14,800 acre-feet respectively, would be shorted. With wet-year conditions, a shortage of about 500 acre-feet would be experienced. No irrigation releases are anticipated during 1991. The Kansas Department of

Wildlife and Parks estimates that 400 acre-feet will be used in the operations of the fish hatchery facility during 1991.
