## Bighorn Lake Forecasting

## Long-Term Issues Group Meeting

Crown Plaza Hotel Billings, Montana

May 21, 2008

U.S. Department of the Interior

Bureau of Reclamation

## Outline

$>$ Deriving Bureau of Reclamation forecast
$>$ Utilization of other forecasts
> NRCS / National Weather Service
> Corps of Engineers
$>$ Final Bureau of Reclamation Forecast
$>$ Interpreting the Forecast

## Data Used to Develop Seasonal Forecasts

- NRCS Snow Data
- NWS Precipitation Data
- Antecedent Conditions
- (October - December Inflows)
- Actual Historic Inflows
- April - July

## NRCS Snowtel Site

Burgess Junction Hansen Sawmill Shell Creek Hobbs Park
Kirwin
Marquette Parkers Peak

Sucker Creek
Bone Springs Divide Burroughs Creek Little Warm
Blackwater
Sylvan Lake

Bald Mountain Sylvan Road South Pass
Togwottee Pass
Evening Star
Sylvan Lake

## Snowtel Sites

Sites Used in Forecasts, and in Daily Monitoring of Snowpack

## Precipitation Stations

- Powell
- Basin
- Cody
- Lovell
- Worland
- Thermopolis
- Sheridan
- Lander
- Riverton

## Antecedent Conditions

- Natural Inflows from the previous months, and current Inflows are looked at when determining the equations we use to predict spring runoff.
- Typically the period from October - December provides the best correlation to predict future runoff.

## Forecast

- Linear Regression is used to derive the forecasting equations.
- Independent Variables
- Snow Station Data
- Precipitation Station Data
- Fall Inflows
- Dependent Variable
- April-July spring flows

## Forecast Development

- Linear Regression is used to evaluate all of the variables to come up with an equation that best matches the Actual Historic Inflows.
- The derived equation for the Equal Chance Forecast will come out something like the examples below.
$\mathbf{R}=0.92$ (coefficient of multiple correlation) Inflow = 27.0(Snow) +10.9(Precip.) +2.7 (IN) -624.8

R = 0.89 (coefficient of multiple correlation) Inflow = 81.99(S1) - 60.85(S2) + 7.7(S3)+38.23(S4) $+72.81(\mathrm{~S} 5)$ +36.49(P1) - 68.23(P2) +103.56(P3) +16.33(P4) +19.92(P5)
+45.26(P6) +43.11(P7) -22.25(P8) -20.57(P9) +43.72(P10) -1191.04

## Statistical Evaluation

Bighorn Basin - April Natural Inflows Forcast

## Interpreting Water Supply Forecasts

- 90 Percent Chance of Exceedance Forecast- There is a 90 percent chance that the actual stream flow volume will exceed this forecast value, and there is a 10 percent chance that the actual stream flow volume will be less than this forecast value.
- 70 Percent Chance of Exceedance Forecast- There is a 70 percent chance that the actual stream flow volume will exceed this forecast value, and there is a 30 percent chance the actual stream flow volume will be less than this forecast volume.
- 50 Percent Chance of Exceedance Forecast- There is a 50 percent chance that the actual stream flow volume will exceed this forecast value, and a 50 percent chance that the actual forecast will be less than this forecast value. Generally, this forecast is the middle of the range of possible stream flow volumes that can be produced given current conditions.
- 30 Percent Chance of Exceedance Forecast- There is a 30 percent chance that the actual stream flow volume will exceed this forecast value, and there is a 70 percent chance that the actual stream flow volume will be less than this forecast value.
- 10 Percent Chance of Exceedance Forecast- There is a 10 percent chance that the actual stream flow volume will exceed this forecast value, and a 90 percent chance that the actual stream flow will be less than this forecast.

## Forecast Exceedance Levels

## April - July Exceedence

- 10\% Chance of Exceedance
$\square 30 \%$ Chance of Exceedance
- Historic Average April-July
$\square$ 50\% Forecast
$\square 70 \%$ Chance of Exceedence
$\square$ 90\% Chance of Exceedance
$\begin{array}{lllllll}0 & 250 & 500 & 750 & 1,000 & 1,250 & 1,500\end{array}$
Inflow (1,000 Acre-Feet)

## Forecast Exceedance Levels

## April-July Exceedance

## Distribution of Inflow Forecast

| $05 / 20 / 2008$ | Bighorn Lake Inflow Most Probable Plan |  |  |  |  |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: | :---: |

| March | 147.2 | 189.0 | 189.7 | 156.7 | 172.2 |  |  |  |  |  |
| April | 132.9 | 175.5 | 176.3 | 142.6 | 158.4 |  |  |  |  |  |
| May | 199.7 | 258.1 | 259.2 | 212.9 | 234.7 |  |  |  |  |  |
| June | 255.6 | 398.1 | 400.7 | 287.9 | 340.9 |  |  |  |  |  |
| July | 155.6 | 248.2 | 249.9 | 176.6 | 211.1 |  |  |  |  |  |
| Aug | 121.2 | 169.5 | 170.3 | 132.1 | 150.1 |  |  |  |  |  |
| Sept | 152.7 | 198.5 | 199.3 | 163.0 | 180.1 |  |  |  |  |  |
| Oct | 161.0 | 205.0 | 205.8 | 170.9 | 187.3 |  |  |  |  |  |
| Nov | 128.6 | 172.1 | 172.9 | 138.4 | 154.6 |  |  |  |  |  |
| Dec | 109.5 | 153.8 | 154.5 | 119.5 | 136.0 |  |  |  |  |  |

## Variability on Forecasts

- Spring precipitation accounting for $30-35 \%$ of the April-July runoff
- Weather conditions
- Precipitation (rain and/or snow)
- Temperatures
- Irrigation demands or withdrawals
- Soil moisture conditions
- High elevation snow versus low elevation snow
- Upstream reservoir and river operations

## Daily Operations Worksheet

## Post Runoff Season Forecast

- Analyze actual April-July runoff
- Compare to Previous Records
- Actual Inflows
- Precipitation
- Snow Water Content
- Forecast future inflows using from previous years of similar characteristics.
