NAVAJO NATION - WESTERN WATER SUPPLY PROJECT - SUPPLEMENTAL REPORT 2000

--- *CONFIDENTIAL INFORMATION* ---

NAVAJO NATION - WESTERN PIPELINE PROJECT
SUPPLEMENTAL REPORT 2000
CHAPTER 1 - GENERAL

CHAPTER 1 - GENERAL

1.1 Introduction: This is a supplement to the Bureau of Reclamation's Phoenix Area Office appraisal level study on the Western Navajo Water Supply Pipeline Project (WNWSPP) entitled, "Navajo Nation's - Western Navajo Water Supply Pipeline Project - Appraisal Level Study," completed in August 1999. The Western Navajo Water Supply Pipeline is the first pipeline section in the "Phase I - North Central Arizona Regional Water Study, (Phase I)" report, which was completed in 1995.

The Western Navajo Water Supply Pipeline begins at Lake Powell and ends at Cameron, Arizona. The distribution points for the proposed Western Navajo Water Supply Pipeline are LeChee, Coppermine, Bitter Springs, Cedar Ridge, Bodaway/Gap, and Cameron, AZ.

In February 2000, the Bureau of Reclamation Phoenix Area Office completed an appraisal level peer review study on the entire Phase I report, which included the Western Navajo Water Supply Pipeline, entitled, "Water Delivery System Analyses - Appraisal Level Peer Review Study of the Arizona Department of Water Resources, Phase I - North Central Arizona Regional Water Study."

This supplemental report reevaluates the costs established in the WNWSPP August 1999 study using information obtained during the Appraisal Level Peer Review of the Phase I Report completed in February 2000. The additional information included updated information on pipeline excavation practices, and additional construction considerations of the narrow canyon between Explosive Rock and Bitter Springs.

This supplemental report evaluates the costs for operation, maintenance and replacement on an inflation rate of 3-percent and interest rate of 6.625-percent over 40 and 100 year periods.

1.2 Capital Costs:

During the WNWSPP August 1999 study the cost for excavation was based on a combination of rock blasting and normal excavation methods. The rock blasting method was considered for half of the entire pipeline length at a cost of \$84.50 per cubic yard, while the remaining excavation was considered to be done under normal methods.

Since the WNWSPP August 1999 study, additional methods of excavation were evaluated. From these methods, rock trenching was considered to be the ideal method because it is faster and the average cost over the entire length of the pipeline was estimated to be \$20 per cubic yard.

Comparing the estimated excavation volumes between the blasting and normal excavation volumes estimated in the WNWSPP August 1999 study (256,000 cubic yards of blasting, and 342,000 cubic yards of normal excavation, for a total of 598,000 cubic yards), to the estimated volume using rock trenching (276,000 cubic-yards) indicates that rock trenching would reduce the amount of material removed. Rock trenching resulted in less yardage being disturbed because the side slopes are normally vertical, in lieu of the one-to-one side slopes used in normal excavation practices. By removing less yardage also lowered the bedding and backfill volumes required, which added to the lower construction costs.

The WNWSPP August 1999 study analyzed two sizes of the pipeline from Lake Powell to Explosive Rock, 18 inch and 24 inch diameters. For comparison of costs, only the 18-inch diameter pipeline cost from the WNWSPP August 1999 study will be used in this supplemental report.

The WNWSPP August 1999 study, evaluated and estimated the costs for the Supervisory Control and Data Acquisition (S.C.A.D.A.) system, power system and cathodic protection system. However, these costs were not incorporated into the Total Capital costs, the operation, maintenance, and replacement totals, so an equal comparison with the Phase I

report cost could be done. This Supplemental 2000 Report includes the systems in the capital, operation, maintenance, and replacement cost totals.

Water Treatment facilities were estimated in the Phase I and the Appraisal Level Peer review studies, but were not included in the capital, operation, maintenance, and replacement costs. It is apparent that a pre-treatment facility may be required near the delivery system intake, but that a treatment facility, or facilities, will be required for any water that will be used for municipal purposes. It is recommended that the treatment facilities be located at the final distribution points, which would treat only the portion of the delivered water that is to be used for municipal purposes. The estimated total capital cost for the pre-treatment and water treatment facilities is \$5 million. However, for the water treatment facilities, this does not include the capital costs for the furnishing and installing a pipeline, to connect the distribution system and the treated water delivery system.

Table S-1 - CAPITAL COSTS

| CAPITAL COSTS - 1999 DOLLARS | | |
|------------------------------|-----------------------------|----------------------------|
| FEATURE | WNWSPP August 1999 Study | Supplement Report 2000* |
| PIPELINE | \$41,067,074 | \$24,900,198 |
| PUMP/MOTOR | \$947,468 | \$947,467 |
| STORAGE | \$4,266,861 | \$4,266,861 |
| STRUCTURES | \$425,278 | \$425,278 |
| WATER TREATMENT | | \$5,000,000 |
| S.C.A.D.A. SYSTEM | | \$648,600 |
| POWER SYSTEM | | \$17,413,352 |
| CATHODIC PROTECTION | | \$251,917 |
| SUBTOTALS | \$46,706,681 | \$53,853,673 |
| CONTINGENCIES 25% | \$11,676,670 | \$13,463,418 |
| MOBILIZATION 2 % | \$934,134 | \$1,077,073 |
| OTHER (ENGINEERING) 25 % | \$11,676,670 | \$13,463,418 |
| TOTAL | \$70,994,155 | \$81,857,583 |

* Includes the CAPITAL costs for the Water Treatment, S.C.A.D.A system, power system, and cathodic protection system.

1.2.1 Capital Costs - Contingencies, Other (Engineering) and Mobilization Costs:

The Phoenix Area Office estimates, for this degree of study, that the percentage for contingencies (unlisted items), and other (Engineering) costs would be approximately 25 percent for each.

The contingency's costs are primarily associated with the construction process, for items that may not have been considered, or not adequately investigated because of the degree of complexity required for this level of study. These costs could include additional work on items such as but not limited to; NEPA studies, right-of way, investigations, design, contract administration, and inspection. However, costs for environmental issues, and obtaining right-of-ways for this project alignment could exceed the estimated percentage due to the locations.

Other engineering costs are considered to be related to the design type features that were not analyzed, because of the degree of complexity required for this level of study and could include items related to the pipeline crossing features similar to, highways, railroads, canyons, valleys, washes, rivers, and/or creeks that could require scour protection, thrust blocks, saddles, or some special structure to protect the pipeline or adjacent structures or features from damage.

The "mobilization" cost is an item used by the Bureau of Reclamation for the purposes of providing for expenses incident to the initiation of construction and discouraging unbalanced bidding. This cost item is intended to compensate the contractors for operations including, but not limited to, the necessary movement of personnel, equipment, supplies, and incidentals to the project site; for the establishment of offices, buildings, plants, and other facilities; for payment of bonds; and necessary payments for acquiring equipment. The Bureau of Reclamation normally estimates the mobilization costs to be 5-percent of the total contract value or less. In this report, the Phoenix Area Office selected 2-percent, based on the size and type of construction work to be accomplished.

Non-contract costs: Non-Contract costs are for items of work, similar too but not limited to the following: Environmental, Easements, Geotechnical, Archeological, Investigations (geological, survey and design types), Construction inspection, and Contract Administration, were not included in this study.

1.3 Operations and Maintenance Costs:

The operation and maintenance costs for S.C.A.D.A. system, power system, cathodic protection system and the water treatment facilities, were evaluated by using either, R.S Means, information obtained from other offices, percentages used in the Phase I report, or combination of these sources. For the S.C.A.D.A. system, power system, cathodic protection system, it was estimated that it would cost about 2.5 percent of the systems construction cost for the annual operation and maintenance costs. For the Water Treatment Facilities, the results indicated that 10 percent of the facilities construction cost would give the approximate yearly cost for operation and maintaining the water treatment plant(s).

Table S-2 Compares the operations and maintenance estimated costs from the WNWSPP August 1999 study, and this Supplemental Report 2000.

Table S-2 - ANNUAL OPERATIONS AND MAINTENANCE COSTS

| OPERATIONS AND MAINTENANCE COSTS - 1999 DOLLARS | | |
|---|-----------------------------|----------------------------|
| FEATURE | WNWSPP August 1999 Study | Supplement Report 2000* |
| OPERATIONS | \$532,414 | \$532,414 |
| MAINTENANCE | \$920,000 | \$920,000 |
| O & M (SCADA,Power,cathodic) | | \$580,000 |
| O & M (water treatment facilities) | | \$500,000 |
| FIRST YEAR ANNUAL COST | \$1,452,414 | \$2,532,414 |

* Includes the OPERATION and MAINTENANCE costs for the Water Treatment, S.C.A.D.A system, power system, and cathodic protection system.

Table S-3 shows the estimated operation and maintenance costs for the first year of the project, and the present value required to be placed in a "Trust Type" fund to cover the life of the project. The trust type fund costs were based on an inflation rate of 3 percent and a interest rate of 6.625 percent over a 40-year and 100-year period.

**Table S-3 - OPERATIONS AND MAINTENANCE COSTS
OVER THE LIFE OF THE PROJECT**

| OPERATION AND MAINTENANCE COSTS OVER THE LIFE OF THE PROJECT COSTS | | |
|--|-------------------------------------|------------------------------------|
| FEATURE | WNWSPP August 1999 Study | Supplement 2000 Report* |
| INFLATION RATE 3-PERCENT; INTEREST RATE 6.625-PERCENT; OVER 40 YEARS | | |
| FIRST YEAR ANNUAL O & M COSTS | \$1,425,414 | \$2,532,414 |
| 1999 DOLLAR - TRUST FUND TYPE - O & M FUNDS | \$29,464,414 | \$52,346,964 |
| INFLATION RATE 3-PERCENT; INTEREST RATE 6.625-PERCENT; OVER 100 YEARS | | |
| FIRST YEAR O AND M COSTS | \$1,425,414 | \$2,532,414 |
| 1999 DOLLAR - TRUST FUND TYPE - O & M FUNDS | \$38,084,534 | \$67,661,610 |

* Includes the OPERATION and MAINTENANCE costs for the Water Treatment, S.C.A.D.A system, power system, and cathodic protection system.

1.4 Replacement Costs:

The life expectancy of the system was considered to be 40 years. The pumps and motors were estimated to have a 20-year life, and the pipeline and structures were estimated to have a 40-year life. The replacement costs (present value) in Table S-5 are the costs today to reconstruct based on the life expectancy of the system. The annual replacement "Sinking Fund" costs are estimated using 3-percent inflation, and 6.625-percent interest over 40 and 100 years, of project operations.

Table S-4 - REPLACEMENT COSTS

| REPLACEMENT COSTS - 1999 DOLLARS | | |
|---|------------------------------------|------------------------------------|
| FEATURE | WNWSP August 1999 Study | Supplement 2000 Report* |
| PIPELINE | \$20,533,537 | \$18,781,119 |
| PUMPS/MOTORS | \$1,894,936 | \$1,894,934 |
| STORAGE | \$4,266,861 | \$4,266,861 |
| STRUCTURES | \$425,278 | \$425,278 |
| WATER TREATMENT | | \$5,000,000 |
| SCADA, POWER, CATHODIC | | \$18,313,869 |
| TOTALS | \$27,120,612 | \$48,682,061 |

* Includes the REPLACEMENT costs for the Water Treatment, S.C.A.D.A system, power system, and cathodic protection system.

NAVAJO NATION - WESTERN PIPELINE PROJECT

CHAPTER 1 - GENERAL

CHAPTER 1 - GENERAL

1.1 General - Introduction and Inputs: This report presents a review of the design and estimated cost of the Navajo Nation's - Western Navajo Water Supply Pipeline Project, which was included as part of the feasibility report titled "North Central Arizona Water Supply Study and Western Pipeline Project" dated May 11, 1995.

The Western Navajo Water Supply Pipeline Project initiates at Lake Powell and ends at Cameron, Arizona. The distribution points for the proposed Western Navajo Water Supply Pipeline Project are LeChee, Coppermine, Bitter Springs, Cedar Ridge, Bodaway/Gap, and Cameron, Arizona.

The following information was taken from the Navajo Nation's 1995 report and used as the basis for this review analysis. The daily water supply demands were estimated using a 2.48 percent annual growth rate to the year 2040. The daily water demand and storage capacities were based on the year 2040 capita, at a daily demand rate of 160 gallons per day per capita, and the storage volume of 2000 gallons per household with 4.5 persons per household. The peak day usage rate used was 2 times the average daily rate.

| CHAPTER COMMUNITY | CAPITA YEAR 2040 | DAILY DEMANDS | | STORAGE GALLONS | PEAK DEMANDS CFS |
|----------------------|---------------------|---------------|-------------|--------------------|------------------------|
| | | GALLONS | CFS | | |
| Lake Powell intake | | | | | |
| LeChee | 5313 | 850,117 | 1.32 | 2,361,333 | 2.63 |
| Coppermine | 1440 | 230,365 | 0.36 | 640,000 | 0.71 |
| Bitter Springs | 1871 | 299,360 | 0.46 | 831,556 | 0.93 |
| Cedar Ridge | 1871 | 299,360 | 0.46 | 831,556 | 0.93 |
| Bodaway / Gap | 1871 | 299,360 | 0.46 | 831,556 | 0.93 |
| Cameron | 3441 | 550,558 | 0.85 | 1,529,333 | 1.70 |
| TOTALS | 15,807 | | 3.92 | | 7.83 |

1.2 Cost Indexing to 1999 dollars: The Navajo Nation's 1995 report presented the cost for the Western Pipeline Project in 1995 dollars. Therefore, to adequately compare costs, the Navajo Nation's 1995 report dollars were index to 1999. The "Index cost trend" used, (Appendix D) was prepared by Bureau of Reclamations, Denver Office, indicates that the 1995 dollar multiplied by 1.13, will bring the Navajo Nations 1995 cost estimate up to the 1999 dollar.

| FEATURE | NAVAJO NATION CAPITAL COSTS | |
|--------------------------|-----------------------------|----------------------|
| | 1995 (\$) | 1999 (\$) |
| INTAKE | \$ 2,000,000 | \$ 2,260,000 |
| PUMPS | \$ 332,799 | \$ 376,063 |
| STORAGE | \$ 2,315,040 | \$ 2,615,995 |
| PIPE | \$ 27,183,223 | \$ 30,717,042 |
| SUBTOTALS | \$ 31,831,062 | \$ 35,969,100 |
| CONTINGENCIES 20% | \$ 6,366,212 | \$ 7,193,820 |
| MOBILIZATION 2 % | \$ 636,621 | \$ 719,382 |
| OTHER (ENGINEERING) 15 % | \$ 4,774,659 | \$ 5,395,365 |
| TOTALS | \$ 43,608,555 | \$ 49,277,666 |

| | NAVAJO NATION OPERATIONS AND MAINTENANCE COSTS | |
|---------------|--|-------------------|
| | 1995 (\$) | 1999 (\$) |
| TOTALS | \$ 541,845 | \$ 612,284 |

The Navajo Nation's report did not indicate replacement costs to provide for a comparison. Therefore, the replacement costs was estimated by using the Navajo Nation's 1995 capital costs and a life expectancy of 20 years for the pumps and motors and 40 years for the remaining major feature, except for the pipeline. The pipeline replacement costs was based on a life expectancy of 40 years but only for 50 percent of the pipelines capital cost because the future installation would not require rock excavation, as anticipated in the initial installation.

Using the Navajo Nation's 1995 capital costs for the estimated costs for replacement, required the 1995 dollar to be index to 1999 dollars for comparison with the values of this review.

ESTIMATING THE NATION'S REPLACEMENT COST

| NATIONS CAPITAL COSTS 1995 (\$) | | ESTIMATING THE NATIONS TOTAL REPLACEMENT COSTS | |
|------------------------------------|----------------------|---|----------------------|
| FEATURE | 1995 (\$) | 1995 (\$) | 1999 (\$) |
| INTAKE | \$ 2,000,000 | \$ 2,000,000 | \$ 2,260,000 |
| PUMPS | \$ 332,799 | \$ 665,598 | \$ 752,126 |
| STORAGE | \$ 2,315,040 | \$ 2,315,040 | \$ 2,615,995 |
| PIPE | \$ 27,183,223 | \$ 13,591,611 | \$15,358,521 |
| SUBTOTALS | \$ 31,831,062 | \$ 18,572,249 | \$ 20,986,642 |

1.3 Cost Comparison -

1.3.1 **Cost Comparison - Capital Costs:** To compare the capital costs, the Navajo Nation's 1995 Report costs were indexed to 1999 dollars. In addition, the following adjustments were included to adequately compare the Total Capital Cost between the two estimates: To the Navajo Nation's Capital cost a "mobilization cost (2 %)" was added, and to the Bureau of Reclamations cost "other (engineering) costs (15 %)" was added. These items were included as specified for comparison purposes only.

COMPARING CAPITAL COSTS - 1999 DOLLARS

| FEATURE | CAPITAL COSTS (\$) MILLIONS | | |
|--------------------------|-----------------------------|-----------------|-----------------|
| | NATIONS | BOR 18-INCH | BOR 24- INCH |
| SUBTOTALS | \$ 35.97 | \$ 46.71 | \$ 49.47 |
| CONTINGENCIES 20% | \$ 7.19 | \$ 9.34 | \$ 9.89 |
| MOBILIZATION 2 % | \$ 0.72 | \$.93 | \$ 0.99 |
| OTHER (ENGINEERING) 15 % | \$ 5.40 | \$ 7.00 | \$ 7.42 |
| TOTALS | \$ 49.28 | \$ 63.99 | \$ 67.77 |

See Appendix B; Tables B-7, B-8 and B-9 for capital cost comparison of individual line items.

1.3.2 Cost Comparison - Operations, and Maintenance Costs:

COMPARING ANNUAL OPERATIONS AND MAINTENANCE - 1999 DOLLARS

| | OPERATIONS AND MAINTENANCE COSTS (\$) MILLIONS | | |
|---------------|--|----------------|----------------|
| | NATIONS | BOR 18-INCH | BOR 24- INCH |
| TOTALS | \$0.612 | \$1.452 | \$1.436 |

See Appendix B; Tables B-6 and B-9.

1.3.3 Cost Comparison - Replacement Costs:

| NATIONS ESTIMATED REPLACEMENT COSTS 1999 (\$) | | RECLAMATION REPLACEMENT COSTS 1999 (\$) | |
|---|----------------------|--|----------------------|
| FEATURE | 1999 (\$) | BOR -18-INCH | BOR - 24-INCH |
| INTAKE | \$ 2,260,000 | | |
| PUMPS | \$ 752,126 | \$ 1,894,936 | \$ 1,787,344 |
| STORAGE | \$ 2,615,995 | \$ 4,266,861 | \$ 4,266,861 |
| STRUCTURES | | \$ 425,278 | \$ 425,278 |
| PIPE | \$ 15,358,521 | \$ 20,533,537 | \$ 21,941,762 |
| SUBTOTALS | \$ 20,986,642 | \$ 27,120,611 | \$ 28,421,243 |

See Appendix B; Tables B-6 and B-9.

1.4 Annual Cost Comparison - Operations, Maintenance, and Replacement Costs:

Annualizing the values for the Navajo Nation's and Reclamations replacement costs, for 40 years at an interest rate of 4 percent, and including the operations and maintenance annual costs, provides the following.

ANNUAL COST FOR OPERATIONS, MAINTENANCE AND REPLACEMENT

| ANNUAL COSTS (\$) MILLIONS | | |
|----------------------------|-----------------|-----------------|
| NATION | RECLAMATION | |
| | 18-INCH | 24-INCH |
| 1999 (\$) | 1999 (\$) | 1999 (\$) |
| \$ 1.672 | \$ 2.822 | \$ 2.872 |

See appendix Tables B-6, B-7, B-8, and B-9 for comparison of individual line items.

1.5 Capital Costs not included in Total (Capital Costs): Cost not included in the Total Capital Cost are the Supervisory Control and Data Acquisition (S.C.A.D.A.) system, power system and cathodic protection system, and are provide below. These items were evaluated in this review but were not included as part of the Total Capital Cost.

| S.C.A.D.A., POWER, & CATHODIC PROTECTION | |
|---|--------------------|
| | 1999 (\$) MILLIONS |
| SUBTOTALS | \$ 18.3 |
| CONTINGENCY 20% | \$ 3.67 |
| MOBILIZATION 2 % | \$ 0.37 |
| OTHER (ENGIN.) - 15 % | \$ 2.75 |
| TOTALS | \$ 25.09 |

See Appendix B; Tables B-4.

(Blank page)

NAVAJO NATION - WESTERN PIPELINE PROJECT

CHAPTER 2 - PROJECT REVIEW ANALYSIS

CHAPTER 2 - PROJECT REVIEW ANALYSIS:

2.1 Distribution locations and quantities: The distribution locations and demands (normal and peak) used in this review were taken from the Navajo Nation report titled; "North Central Arizona Water Supply Study and Western Pipeline Project" dated May 11, 1995. The normal demand volumes were based on the projected growth to the year 2040 at 160 gallons per day per capita. The peak distribution volumes were based on a peaking factor of 2 times the normal demand volume. The peak distribution volumes were used to evaluate the Western Pipeline Project which includes: pressure pipeline, pumping structures, and pressure reducing or flow control structures. The normal distribution volumes were used to evaluate the operational, and maintenance cost for the Western Pipeline Project. The normal and peak distribution volumes and locations are as follows:

| DISTRIBUTION LOCATION | NORMAL WATER DEMANDS | | | PEAK DEMAND |
|-----------------------|----------------------|-------------|-------------|-------------|
| | AC-FT/YR | AC-FT/DAY | CFS | CFS |
| LeChee | 956 | 2.62 | 1.32 | 2.63 |
| Coppermine | 259 | 0.71 | 0.36 | 0.71 |
| Bitter Springs | 332 | 0.91 | 0.46 | 0.93 |
| Cedar Ridge | 332 | 0.91 | 0.46 | 0.93 |
| Bodaway/Gap | 332 | 0.91 | 0.46 | 0.93 |
| Cameron | 617 | 1.69 | 0.85 | 1.70 |
| TOTAL | 2,828 | 7.75 | 3.91 | 7.83 |

2.2 Storage: In this review 6 storage/regulating tanks and one regulating tank, at Page Arizona, were utilized to meet the storage and operating requirements. The 6 storage/regulating tanks were situated near the pipeline distribution locations, with the exception of Bitter Springs. The Bitter Springs storage/regulating tank was located near Explosive Rock. Explosive Rock is the highest point along the alignment and placing the storage/regulating tank at Explosive Rock would assist in the protection of the pipeline

against surge (water hammer) and would still provide Bitter Springs with the required storage volume at a constant pressure without the assistance of a pump and motor.

To maintain the storage volume required, in the 6 storage/regulating tanks, and to help protect the pipeline system during surges (water hammer), an additional volume of water, one percent of the storage volume, was included with the storage tank volumes. The one percent operating volume was determined by estimating the water required to support the pipeline system in case of a power failure.

The regulating tank, at Page Arizona, was included for pipeline protection and system operations. The size, 850,000 gallons, was determined by providing a volume that would supply approximately 4 hours of peak delivery rate of 7.83 cfs, or 8 hours of normal delivery rate of 3.91 cfs.

The total installed estimated cost for the storage/regulating tanks was approximately \$ 4.3 million, (See appendix Table B-2).

STORAGE AND OPERATING WATER DEMANDS

| DISTRIBUTION LOCATION | POPULATION | GALLONS | | |
|-----------------------|------------|-----------|-----------|-----------|
| | YEAR 2040 | STORAGE | OPERATING | TOTAL |
| Page | | | 850,000 | 850,000 |

2.3 Pipeline: In this review, the design of the pipeline was based on the peak delivery demands, which was estimated by the Navajo Nations report to be two times the normal delivery demands. The normal daily delivery rate from Lake Powell was estimated at 3.92 cubic feet per second (cfs), with a peak delivery rate at 7.83 cfs. The normal daily delivery rate was based on the projected population in the year 2040 (rate of population growth per year of 2.48 %) using 160 gallons per capita per day. The velocities in the pipeline were limited to less than 5 feet per second (ft/s).

The design of the pipeline included; pipeline, pumping stations, storage/regulating tanks, and pressure reducing or flow control stations. Additional items included in this report but not included in the capital cost were cathodic protection, power system, and Supervisory Control and Data Acquisition (S.C.A.D.A.).

The pipeline alignment parallels State Route 89 and is estimated at 83 miles long. The alignment, elevations and distances were based on the United States Geological Survey (USGS) 1:24000 scale quad maps. Excavation of the pipeline and related structures were considered to be in rock for 50 percent of the length of the pipeline. The normal excavation and backfill was with side slopes at approximately 1:1, except in rock. The rock excavation and backfill was estimated at 75 percent of the normal since the side slopes could be much steeper. The nominal cover was estimated at 4 feet over top of the pipeline.

Excavation conditions for the pipeline and related structures are not known. The General Soil Map of Coconino County (Soil Conservation Service, May 1972) indicates that most of the area is Moenkopie - Rock outcrop association and Sheppard - Rock outcrop association. These are described as containing 20 and 30 percent rock outcrops. Moenkopie - Rock outcrop soils are usually underlain by sandstone at depths of nine to twenty inches but maybe as shallow as five inches. Sheppard soils are sandy and thicker (60-inches or more). According to the Geologic Map of Arizona (1988) , bedrock in the northern third of the project is Navajo sandstone, the middle third in Moenkopie formation and the southern third is Chinle formation. For this estimate it was assumed that 50 percent of the excavation would be in rock and 50 percent could be excavated by common methods or by ripping.

The rock excavation could be accomplished by blasting or rock trenching. The estimated average cost is \$ 84.50 per yard for excavating in the rock. This cost makes up more than \$23 million or about 60 percent of the total capital costs. A more economical method may be considered, which would be to use a track trencher, that could cut the trench to the required width and depth. A recent project completed near the Grand Canyon for installation of a 200-mm (8-inch) diameter sewer line was bid at \$220 per meter (\$ 67/ft) and excavation was by trenching through topsoil and limestone to depths of five to eight feet. On that project, spoil created by the trenching was allowed to be used as backfill in the trench. A recent Reclamation project using a trencher was bid at \$75 per linear foot to furnish and install a 12-inch diameter utility pipe. The rate of excavation by trencher is dependent upon depth to rock and the rocks strength characteristics. Since these are not known it is difficult to estimate costs. It is possible that using a trench excavator could cost approximately \$40 per linear foot. This would reduce the rock excavation to around \$ 9,000,000 at a savings over this estimated cost of about \$14,000,000.

The pipeline analysis estimated that to deliver the peak demand water, would require 5 pumping stations, 7 storage/regulating tanks, and 5 pressure reducing or flow control stations, all connected by a pipeline that ranged from the initial 18 or 24-inches diameter, from Lake Powell to Explosive Rock, 15-inch from Explosive Rock to Cedar Ridge, and 10-inch from Cedar Ridge to Cameron, Arizona. The pipeline begins at the lowest elevation of the system, Lake Powell. Lake Powell's water level varies from elevation 3600 to 3700 feet, and to ensure water availability the intake was estimated at an elevation 3550. The highest elevation of the system was in the Explosive Rock area, which was between Coppermine and Bitter Springs at an estimated elevation 6130, approximately 21.3 miles from the start of the pipeline. Cedar Ridge was the second highest area of the system at elevation 5910, approximately 44.3 miles from the start of the pipeline.

The pipeline pressures in this review ranged up to 500 pound per square inch (psi), (See Appendix C; Table C-1 and Figure 3). The higher pressures were principally at the bottom of the gravity sections and at the discharge points of the pumping stations. In this review the pressure in the gravity portions of the pipeline was controlled by installation of pressure reducing and or flow control structures, and by using smaller diameter pipe, and allowing

friction to reduce the pressure. However, if the pressure in the pipeline pumping portion of the system, was to be reduced, it would require additional pumping stations to be installed. In the review process the costs between using the higher pressure pipeline and increasing the number of pumping stations was evaluated. The evaluation included the costs pumps and motors, structures, power system, S.C.A.D.A. system, operations, maintenance and replacement costs.

The types of pipeline material evaluated consisted of steel, ductile iron, concrete and Poly-Vinyl Chloride (PVC). See Section 4.0 Pipeline Material Evaluation.

For the peak pumping demands from Lake Powell to Explosive Rock two different sizes of pipeline were evaluated, 18-inch and 24-inch, which provided a velocity that was less than 5 feet per second, (fps). The evaluation between the two different sizes of pipeline was to compare the costs between furnishing and installing vs. the operational costs. The results show that the 18 inch pipeline was less expensive to furnish and install but was slightly more expensive to operate. The amortized cost were closely comparable for both sizes of pipeline.

The total installed estimated capital cost, without markups, for the pipeline was approximately \$ 41.1 million and \$43.9 million, for the 18 inch and 24 inch diameter pipeline, respectively, (See appendix Table B-1).

2.4 Pumping Plants and Pressure Reducing or Flow Control Stations: The initial pumping station site at Lake Powell is outlined in the report titled: "Western Navajo Water supply Project Lake Powell Pumping Station" dated July 1999. The estimated cost for this pumping station is covered in this report. The total installed estimated cost for the pumping plants and pressure reducing or flow control stations was approximately \$ 1.5 million (see appendix Table B-3).

The pumping stations were positioned downstream of the storage reservoir tanks, and would lift the water to the next reservoir, which was generally located near the anticipated distribution point. The highest system pressure in this report between LeChee -

Coppermine, and Bitter Springs - Cedar Ridge, is approximately 500 pounds per square inch. Explosive Rock area, which is between Coppermine and Bitter Springs, is considered the highest point along this pipeline study, and Cedar Ridge area is the next highest.

In the gravity portion of this study, from Explosive Rock to Bitter Springs and from Cedar Ridge to Cameron, pressure reducing or flow control stations are required to minimize the pressure build up in the pipeline and maintain the flow.

2.5 Cost Data- Construction: The construction costs for furnishing and installing the Western Navajo Water Supply Pipeline which includes: pump/motor units, storage/reservoir tanks, structures, cathodic protection, supervisory control and data acquisition system, and pipeline, were taken from 1999 Heavy Construction Cost Data, and/or 1999 Mechanical Cost Data. The Power System construction costs used were from study prepared by the Bureau of Reclamation Technical Service Center, Denver, Colorado, on the "Power System to Support the Lake Powell - Black Mesa Pipeline Project" dated July 1999. The estimated Capital cost for installing the Navajo Nation - Western Pipeline Project is in the range of \$ 49 million to \$ 52 million, (See appendix Table B-5). This capital cost does not include the cost for S.C.A.D.A, power system and cathodic protection, which is estimated at \$ 22 million, (See appendix Table B-5).

Included with the Capital costs (See appendix Table B-5) is a line item called "contingencies and unlisted items 20 percent". This item covers construction items that could required additional construction considerations but are not known at this time. The additional considerations could be related to pipeline crossing; highways, railroad, canyons, valleys, washes, rivers, and or creeks, and could require scour protection, thrust blocks, saddles, or some special structure to protect the pipeline or adjacent structures or features from damage.

2.6 Cost data- Operation, Maintenance and Replacement:

2.6.1 Cost data-Operation: The cost for operating the system are based on the power required to deliver the demand volumes at a rate of 0.060 mills per kilowatt-hour.

10 mills

2.6.2 Cost data-Maintenance: The cost for the maintenance was based on an estimated number of employees that would be required to maintain the system and a value for the equipment and materials required by the personnel for doing the work.

2.6.3 Cost data-Replacement: The cost for replacement was based on the life expectancy of the system. The pumps and motors were estimated to have a 20 year life, while the pipeline and structures were estimated with a 40 year life expectancy. The replacement costs for the pipeline were based on normal excavation requirements, with no rock excavation. The value for the system replacement was annualized over the next 40 years for the "estimated future value" of construction at a interest rate of 4 percent.

2.7 Pipeline Project Systems not included in the Capital Costs:

2.7.1 Cathodic Protection: In the analysis, cathodic protection was included to ensure electrical continuity of the system. The number of test stations that were estimated was based on the topographical features, (fence lines, road intersection, power line crossings, section lines, etc) that existed along the pipeline alignment right of way. Outside of the requirements for the topographical features, the test stations were considered to be at a maximum of 1000 feet apart. The test stations were considered to be the two wire type, one wire for bonding while the other wire for determining pipe to soil potentials. The estimated cost for installing the cathodic protection is \$ 0.25 million, (See appendix Table B-4).

In accordance with the United States Department of Agriculture, Soil Conservation Service report "General soil Map, Coconino County, Arizona "revised May 1972, the corrosivity of the soil is moderate to high for uncoated steel, and low to high for concrete. Therefore, external surface protection may be required on the pipeline and structures to help minimize corrosion.

2.7.2 Supervisory Control and Data Acquisition (S.C.A.D.A.): The S.C.A.D.A. system is considered to provide control and monitoring of all the features in this study. The principle features of a S.C.A.D.A. system are fiber optic cable, microwave radio

communications, and a master control station. The estimated cost for installing the S.C.A.D.A. system is \$ 0.65 million, (See appendix Table B-4).

The S.C.A.D.A. system at a minimum would control, monitor and record the pumping stations, storage and regulating tanks, and the initial point of each distribution points, assuring that the system equilibrium is maintained.

The pumping stations, pump into a storage reservoir, and the storage reservoir supplies the next pumping station, and distribution pipeline. The pumps would start or stop based on the information received from the upstream and downstream storage and regulating tanks to keep the system in balance. The information at each pumping station can be collected and processed from control logic at a Remote Terminal Unit (RTU). The data from the RTU's will communicate with the master control station via the fiber optic cable or radio communications.

The fiber optic cable can be included in the same trench as the pipeline, or can be installed with the overhead power cabling. The master control unit allows operations personnel to monitor the activity and status of the entire system, which can be encompassed into an existing Supervisory Control and Data Acquisition system.

2.7.3 Power System:

NOTE: No discussions have been held with an existing power supplier for connections to or for willingness to provide power or services.

The power delivery system for the Navajo Nation Western Water Supply Project would be required to serve the pumping plants and associated features for the proposed pipeline project which is approximately 83 miles long. In addition, potential water treatment facilities, for each distribution system and a Supervisory Control Operations Center could be served. The loads used in this study are shown in Table 1 - System Estimated Power Loads. The estimated cost for installing the power system is \$ 17.5 million, (See appendix Table B-4).

Utilizing the guideline used in the study prepared by the Bureau of Reclamation Technical Service Center, Denver, Colorado, on the "Power System to Support the Lake Powell - Black Mesa Pipeline Project" dated July 1999, to estimate the power level required for the Western Water Supply Pipeline system. It was determined that a 69 kV-voltage level power system would be the most appropriate voltage level.

To enhance the reliability of the system, two connection taps to the Power Grid System are proposed. The connection taps proposed would be located at Page, Arizona, which would service from Lake Powell to Coppermine, Arizona; the second around Bodaway/Gap, Arizona area, which would service from Bitter Springs to Cameron, Arizona.

The power delivery system was analyzed for overhead conductor on wood pole structures, with ground wire(s). The fiber optic cable used to support the communication/telemetry needs of the S.C.A.D.A. system could be included in the overhead power system.

TABLE 1 - SYSTEM ESTIMATED POWER LOADS
 NAVAJO NATION - WESTERN PIPELINE PROJECT

| LOAD POINTS | HP | MWatts | MVars | HP | MWatts | MVars |
|-------------------------------|---------|---------|---------|---------|---------|---------|

| SERVICE CENTER | | 1.00 | 0.60 | | 1.00 | 0.60 |

2.8 Non-contract: The costs associated with Non-Contract costs were not included in this report. Non-Contract costs are similar to but not limited to the following: Environmental; Easements; Geotechnical; Archeological; Investigation, geological, survey and design; Design; Construction inspection; and Contract Administration.

NAVAJO NATION - WESTERN PIPELINE PROJECT

CHAPTER 3 - REDUCING THE PIPELINE PROJECT
PEAK DELIVERY RATES

CHAPTER 3 -REDUCING THE PIPELINE PROJECT PEAK DELIVERY RATE:

3.1 Reducing the Peak Delivery Rate to 1.5 Times Normal Delivery Rates: The pipeline system was evaluated using a peak delivery rate of 1.5 times the normal delivery rate at 5.87 cfs, in lieu of the 2 times the normal delivery at 7.83 cfs.

USING A PEAK DELIVERY RATE OF 1.5 TIMES THE NORMAL DAILY RATE

| CHAPTER COMMUNITY | CAPITA YEAR 2040 | DAILY DEMANDS | | STORAGE GALLONS | PEAK DEMANDS CFS |
|----------------------|---------------------|---------------|-------------|--------------------|------------------------|
| | | GALLONS | CFS | | |
| Lake Powell intake | | | | | |
| LeChee | 5313 | 850,117 | 1.32 | 2,361,333 | 1.98 |
| Coppermine | 1440 | 230,365 | 0.36 | 640,000 | 0.54 |
| Bitter Springs | 1871 | 299,360 | 0.46 | 831,556 | 0.69 |
| Cedar Ridge | 1871 | 299,360 | 0.46 | 831,556 | 0.69 |
| Bodaway / Gap | 1871 | 299,360 | 0.46 | 831,556 | 0.69 |
| Cameron | 3441 | 550,558 | 0.85 | 1,529,333 | 1.28 |
| TOTALS | 15,807 | | 3.92 | | 5.87 |

Four pipeline sizes were evaluated 24, 18, 15, and 12 inch diameters, for the peak delivery rate of 1.5 times the normal delivery rate. The 12-inch, pipeline was not considered since the velocity was over 5 fps and the frictional head was high. The 15-inch pipeline also had a high frictional head, and a velocity just below 5 fps. The 18-inch and 24-inch would be the pipeline sizes that best suited the peak delivery rate of 1.5 times the normal delivery rate. The capital and annualized cost for operations, maintenance and replacement for the 15-inch, 18-inch and 24-inch diameter pipelines for the 1.5 times the normal delivery rates and the 18-inch and 24-inch pipeline sizes for the 2.0 times the normal delivery rate, are shown below for comparison.

COSTS for PEAK DELIVERY OF 1.5 TIMES NORMAL DELIVERY- 1999 DOLLARS

| FEATURE | PIPELINE SIZES FOR 2.0 PEAK DELIVERIES | | PIPELINE SIZES FOR 1.5 PEAK DELIVERIES | |
|--------------------------------|---|---------|---|----------|
| | 24-INCH | 18-INCH | 24-INCH | 18-INCH |
| VELOCITIES (fps) | 2.49 | 4.43 | 1.87 | 3.32 |
| CAPITAL COSTS (\$ MILLIONS) | \$ 67.77 | \$63.99 | \$ 67.45 | \$ 63.64 |
| ANNUAL O, M, & R (\$ MILLIONS) | \$ 2.89 | \$ 2.84 | \$ 2.87 | \$ 2.81 |

The volume difference between using the peak delivery rates of 1.5 in lieu of the 2.0 times the normal delivery rate is approximately 900 gallons per minute. The difference between the capital costs for the peak delivery rates of 1.5 and 2.0 times the normal delivery rate are approximately: \$ 320,000 for the 24-inch diameter and \$ 350,000 for the 18-inch diameter. The difference in the annual operation, maintenance, and replacement costs is approximately: \$ 20,000 for the 24-inch and \$ 30,000 for the 18-inch diameters.

NAVAJO NATION - WESTERN PIPELINE PROJECT

CHAPTER 4 - PIPELINE MATERIAL EVALUATION

CHAPTER 4 - PIPELINE MATERIAL EVALUATION

4.1 Pipeline Material Evaluation:

POLY-VINYL CHLORIDE (PVC): Poly-Vinyl Chloride (PVC) pressure pipe up to and including diameters of 24-inches can be used for lower pressure pipelines. PVC is more resistant to corrosion, generally less expensive than steel, ductile iron and concrete pipelines for smaller diameter pipelines. However, the financial advantages of PVC pipe decreases for pipe size larger than 12-inches in diameter.

The PVC pressure rating depends on the standard dimension ratio (SDR) which is the pipe diameter to thickness ratio. The SDR provides the pressure rating of the pipe. If surge or water hammer pressure are considered then the SDR rating is the maximum pressure of the pipe. Therefore, the working pressure would be less than 66 percent of the SDR pressure.

From the ASTM D2241, with the pipe material meeting the requirements for PVC 1120, 1220, or 2120, the SDR pressure ratings for SDR-17 is 260 psi, SDR-21 is 200 psi, and SDR-26 is 160. Therefore, PVC could be used for portions of the pipeline project if the working pressure is less than 66 percent of the SDR pressure rating.

CONCRETE PIPE: Reinforced concrete pipe is not available for pressures in the 500 psi range. Standard reference concrete pipe is ASTM C361. Concrete pipe can be used for crossing under streams, creeks etc. if the internal pressures were to high.

STEEL PIPE / DUCTILE IRON: Steel pipe can be obtained commercially in a variety of sizes and pressure ranges. If the size or pressure required exceeds what is commercially available, steel pipe can be manufactured to meet the needs. When obtained commercially the thickness of the pipe is usually classified for each size by a Schedule Number. When using the commercial sizing the diameters are the nominal inside diameters for pipe sizes up to and including 12-inches, but when the diameters are over 12-inches the commercial sizing is for the outside diameter of the pipe.

The working pressure of a steel pipeline is usually based on half of the allowable yield strength, of the material used. The surge (water hammer) is usually 1.5 times the working pressure or 75 % of the yield strength.

Steel pipe will usually require an internal and external coatings to be applied. Cement mortar lining or epoxy for the internal coating, and there are several different types of external coatings i.e. tape, polyurethane, or mortar coating. Price per foot of steel pipe depends primarily on the weight.

Ductile iron pipe is similar to steel, and could be used in lieu of the steel.

For this review the cost per linear foot for the pipeline was based on the following:(steel)

24 inch ranged from \$ 50 to \$ 85 per linear ft., depending on the pressure, used (\$60).

18 inch ranged from \$ 45 to \$ 60 per linear ft., depending on the pressure. used (\$50).

15 inch ranged from \$ 30 to \$ 48 per linear ft., depending on the pressure. used (\$37)

10 inch ranged from \$ 20 to \$ 35 per linear ft., depending on the pressure. used (\$25).

|--|---------------------|
| | NOTES 5 and 7 |
| | 1999 (\$) |
| SUBTOTALS | \$18,313,869 |
| CONTINGENCY 20% | \$3,662,774 |
| MOBILIZATION 2 % | \$366,277 |
| OTHER (ENGIN) - 15 % | \$2,747,080 |
| TOTALS | \$25,090,001 |

- NOTE 1 Values used are from the Navajo Nation DWR-WMB report titled, " North Central Arizona Supply Study and Western Pipeline Project " dated May 11, 1995, and are 1995 dollars.
- NOTE 2 Values are from the Navajo Nation DWR-WMB report multiplied by the index cost trend value (1.13) to bring to 1999 dollars.
- NOTE 3 Reclamations cost estimate for the 18-inch pipeline option.
- NOTE 4 Reclamations cost estimate for the 24-inch pipeline option.
- NOTE 5 Cost estimate for Supervisory Control and Data Acquisition, (S.C.A.D.A.), Cathodic Protection, and the Power System.
- NOTE 6 Mobilization cost of 2% was added to Navajo Nation estimate, for comparison with Reclamation's, which was not included in the Nation's estimate.
- NOTE 7 Bureau of Reclamation utilized the Navajo Nation's "Other (Engineering) cost of 15 % " for direct comparison of final costs. Reclamation may not agree with this percentage rate.
- NOTE 8 Navajo Nation's report did not include a replacement cost. Therefore, for comparison, using a life expectancy for the pumps and motors 20 years and the remaining major features 40 years. The pipeline replacement costs were estimated at 50 % of the construction costs, since construction costs included rock excavation.

NOTE: The land indexes have been reinstated as part of the Construction Cost Trends. Because of a newly located source of land values from the U.S. Department of Agriculture, it was apparent that our previously published land index values lagged actual values significantly. Because of this it was necessary to recompute our values from 1985 forward.
