

# Weekly Assessment of CVP and SWP Delta Operations on ESA-listed Species

**April 11, 2023** 

# **Executive Summary**

#### **Operational Conditions**

See Weekly Fish and Water Operation Outlook document for April 11 – April 17 which includes the initial CVP and SWP operational intent and biological justification for the next seven days. Any recommended changes or alternatives to those operations made by either monitoring team is captured herein.

#### Winter-run Chinook Salmon

Loss of natural winter-run Chinook Salmon (by length at date, LAD) has not occurred in the past week at the State and Federal fish salvage facilities (WY 2023 total loss = 89.02 fish, as of 4/10/2023). Loss of natural winter-run Chinook Salmon at the Central Valley Project (CVP) and State Water Project (SWP) fish collection facilities may occur over the next week. 28-44% of juvenile natural winter-run Chinook Salmon from brood year (BY) 2022 are estimated to be present in the Delta. The Delta Cross Channel (DCC) gates closure for the season reduces exposure of winter-run Chinook Salmon juveniles that are present in the Sacramento River near the DCC gates into the interior Delta.

#### Spring-run Chinook salmon

Loss of natural spring-run Chinook Salmon (by length at date, LAD) has occurred in the past week at the State or Federal fish salvage facilities (WY 2023 total loss = 74.02 fish as of 4/10/2023). Loss of spring-run Chinook salmon at the CVP and SWP fish collection facilities may occur over the next week. 65-75% of juvenile natural spring-run Chinook Salmon from brood year (BY) 2022 are estimated to be present in the Delta. The DCC gates closure for the season reduces exposure of spring-run Chinook Salmon juveniles that are present in the Sacramento River near the DCC gates into the interior Delta.

#### **Central Valley Steelhead**

Loss of natural California Central Valley (CCV) steelhead has occurred in the past week at the State and Federal fish salvage facilities (WY 2023 December 1 - March 31 total loss = 1015.16 fish, April 1 – June 15 total loss = 121.24 fish, as of 4/11/2023). Loss of Central Valley steelhead at the CVP and SWP fish collection facilities is likely to occur over the next week. 25-45% of juvenile natural CCV Steelhead from brood year (BY) 2022 are estimated to be present in the

Delta. DCC closure for the season reduces exposure to Central Valley steelhead juveniles that are potentially present in the Sacramento River near the DCC gates.

## **Green Sturgeon**

Loss of green sturgeon has not occurred in the past week at the State and Federal fish salvage facilities (WY 2023 total loss = 0 fish, as of 4/11/2023). Loss of green sturgeon is unlikely to occur over the next week due to their rare presence in the South Delta.

#### **Delta Smelt**

Based on recent detection data and distribution patterns over the past decade, Delta Smelt are spawning and larval Delta Smelt are present. Since 3/20/2023, one marked adult Delta Smelt was detected by surveys in the Sacramento Deepwater Ship Channel. Six larval Delta Smelt (one confirmed/five preliminary) were detected between 3/13/2023-3/15/2023. The most recent detections of Delta Smelt in salvage were two marked Delta Smelt detected at the CVP and SWP on 3/2/2023. Three-day average water temperature at Jersey Point exceeded 12° C on 3/18/2023, and the most recent Secchi depths in the South Delta were below 1m, triggering COA 8.5.2. However, these actions are not controlling OMRI. Due to highly positive QWEST and OMRI, overall risk for entrainment is low for all life stages of Delta Smelt throughout the Delta.

#### **Delta Cross Channel Gates**

The DCC gates were closed on 11/28/2022 to meet LTO Proposed Action and are expected to remain closed until May. DCC gates may only be opened to maintain water quality under D-1641 between November and January.

#### **Monitoring Teams summary**

There were no non-consensus issues to report from the Salmon Monitoring Team.

There were no non-consensus issues to report from the Smelt Monitoring Team.

# **Operational and Regulatory Conditions**

See current Weekly Fish and Water Operation Outlook document.

# Biology, Distribution, and Evaluation Winter-run Chinook salmon, Spring-run Chinook salmon, Central Valley Steelhead

#### **Population Status**

#### Winter-run Chinook Salmon

- Delta Life Stages:
  - Juveniles, Adults

- Brood Year 2022 Productivity:
  - Natural winter-run Chinook salmon: Draft Juvenile production estimate (JPE) calculations have been established for brood year (BY) 2022 winter-run Chinook salmon. The final BY 2022 JPE is 49,924 natural origin juvenile winter run Chinook salmon.
  - Mean cumulative weekly passage of winter-run Chinook salmon through 4/8/2023 at Red Bluff Diversion Dam (RBDD) for the last 20 years of passage data is 99.9% (one SD of 0.1%). By 4/8/2023, 239,409 winter-run Chinook salmon were estimated to have passed RBDD compared to the cumulative passage last year of 572,568 winter-run Chinook salmon.
  - Hatchery winter-run Chinook salmon:
    - Approximately 432,458 Livingston Stone NFH brood year 2022 winter Chinook salmon were released at dusk on 1/26-1/27/2023 into the Sacramento River at John F. Reginato River Access boat ramp, Redding, CA. This is the first release of LSNFH brood year 2022 hatchery winter Chinook salmon comprising of approximately 58% of the total hatchery production for the Sacramento River supplementation program. The release group is 100% marked (adipose-fin clip and CWT) with an overall estimated average fork length of 85mm. There has been no loss so far this water year with this release group.
    - Approximately 299,866 Livingston Stone NFH brood year 2022 winter Chinook salmon were released at dusk on 3/1/2023 into the Sacramento River at John F. Reginato River Access boat ramp, Redding, CA. This is the final release for the Livingston Stone NFH brood year 2022 winter Chinook Salmon supplementation program. This release group 100% marked (with an adipose-fin clip and CWT) and has an overall estimated average fork length of 85 mm. There has been no loss so far this water year with this release group.
    - Approximately 97,134 Coleman NFH Complex brood year 2022 winter Chinook Salmon were released on March 17, 2023. The release took place on the North Fork Battle Creek at Wilson Hill Bridge near Manton, CA. This is the first release of the brood year 2022 Jumpstart winter Chinook Salmon, and the only release of fish reared at the Mount Lassen Trout Farm, a private aquaculture facility located on North Fork Battle Creek. This group is 100% marked (with an adipose-fin and a left pelvic-fin clip and CWT).

#### Spring-run Chinook Salmon

• Delta Life Stages:

- Young-of-year (YOY) and Yearlings
- Brood Year 2022 Productivity:
  - Natural spring-run Chinook salmon: No JPE has been established for spring-run Chinook salmon.
  - Hatchery spring-run Chinook salmon surrogates associated with the Proposed Action (PA 4.10.5.10.2 Additional Real-Time OMR Restrictions and Performance Objectives):
    - Approximately 71,057 late-fall Chinook salmon from Coleman National Fish Hatchery were released at Battle Creek on 12/5/2022. This group is 100% marked with adipose-fin clip and CWT and have an estimated average fork length of 145mm. This is the first spring-run Chinook salmon surrogates release group associated with the Proposed Action. There has been no loss this water year of fish associated with the first surrogate release group.
    - Approximately 66,735 late-fall Chinook salmon from Coleman National Fish Hatchery were released at Battle Creek on 12/23/2022. This group is 100% marked with adipose-fin clip and CWT and have an estimated average fork length of 145mm.
    - Approximately 60,712 Coleman NFH brood year 2022 late-fall Chinook Salmon on January 13, 2023 into Battle Creek at Coleman NFH. This group is 100% marked (with an adipose-fin clip and CWT) and has an overall estimated average fork length of 145 mm.
  - There has been loss this water year of fish associated with the first, second, and third surrogate release groups.
  - The agencies in the SaMT discussed the thiamine vitamin deficiency that was observed in winter run Chinook salmon broodstock at the Livingston Stone National Fish Hatchery (LSNFH) in BY 2022. Last year the thiamine deficiency appeared to negatively affect survival of juvenile fish as they migrate downstream towards the Delta. The thiamine deficiency issue is also likely impacting springrun Chinook salmon.

#### Central Valley Steelhead

- Delta Life Stages:
  - Spawning Adults, Kelts, Juveniles
- Brood Year 2022 Productivity:

- Spawner abundance: There is limited information about the adult steelhead population. It is estimated to be small, contributing to the limited productivity of the population.
- Natural steelhead: No JPE has been established for steelhead. Data are limited.
- Hatchery steelhead: Reclamation's Proposed Action has no hatchery steelhead triggers.

#### **Distribution**

#### Winter-run Chinook Salmon

#### **Current Distribution:**

- For Winter-run Chinook Salmon observations reported to SaMT since previous meeting, see Table 1.
- For SaMT distribution estimates, see Table 2.
- There is uncertainty in the identification of some untagged salmonids potentially due to either tag loss or poor quality adipose clipping from hatchery releases made in the South Delta. Lower rates of tagging success were confirmed for by hatchery staff for some releases. Confirmation of origin of these fish will be through genetic identification.
- For fish observed in salvage and genetically analyzed through 3/15/2023, one has been genetically identified as Winter-run Chinook Salmon (see attachment A). The single winter-run LAD Chinook Salmon observed at the CVP facility on 2/23/2023 was genetically identified as a winter-run for a loss of 2.88. One winter-run LAD was observed at the CVP on 4/3/2023 and was genetically assigned as a fall run with a "late" adult return time classification.

#### **Historic Trends**

- For historical winter-run Chinook salmon trends in salvage, see Table 3.
- Loss of natural winter-run Chinook salmon at the CVP and SWP fish collection facilities may occur over the next week based on life history and detections in real-time monitoring locations in the Delta. However, if historic trends in salvage were to continue, winter-run Chinook salmon loss is expected to decrease over the next week.

#### Forecasted Distribution within Central Valley and Delta regions

- Movement of winter-run Chinook salmon juveniles into the lower reaches of the Sacramento River and upper Delta may continue over the next week.
- The STARS model projects route-specific proportion of entrainment, survival, and travel times (Table 5). This model does not estimate entrainment into the lower Sacramento

River sloughs (i.e., Three-Mile Slough). The DCC gates were closed 11/28/22 and are expected to remain closed through mid-May 2023.

#### Spring-run Chinook salmon

#### **Current Distribution**

- For Spring-run Chinook salmon observations reported to SaMT since previous meeting, see Table 1.
- For SaMT distribution estimates, see Table 2.

#### **Historical Trends**

• For historical spring-run Chinook salmon trends in salvage, see Table 3. If historic trends in salvage were to continue YOY spring-run Chinook salmon loss is unlikely to increase over the next week.

## Forecasted Distribution within Central Valley and Delta regions

• Yearling spring-run Chinook are thought to be migrating through the Delta.

#### Central Valley Steelhead

#### **Current Distribution**

- For CCV Steelhead observations reported to SaMT since previous meeting, see Table 1.
- For SaMT distribution estimates, see Table 2.

#### **Historical Trends**

• For historical CCV steelhead trends in salvage, see Table 2. If historic trends in salvage were to continue, juvenile CCV steelhead loss may occur over the next week.

#### Forecasted Distribution within Central Valley and Delta regions

- The entrainment tool estimates of CCV steelhead loss to be moderate (Table 6, Fig. 1).
- Closure of the DCC gates for the season will reduce exposure and possible entrainment of juvenile CCV steelhead from the Sacramento River into the interior Delta via the DCC gates.

Table 1. Fish observation reported since the previous SaMT meeting. NAs represent no data reported. See Operations Outlook for notes on interruptions in any surveys.

#### Winter Run Loss 2023-04-07 Water Year: 2023 & WY.week 27

#### Steelhead Loss 2023-04-07 Water Year: 2023 & WY.week 27

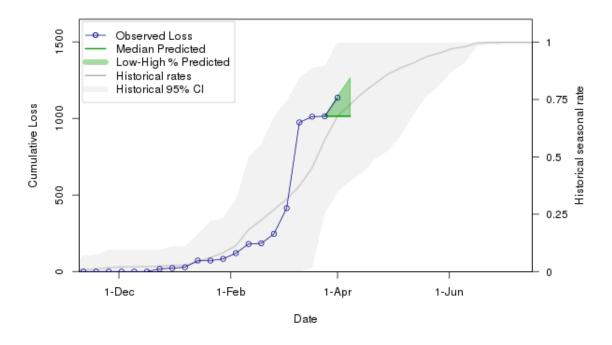

Figure 1. Predicted weekly loss of steelhead and winter-run Chinook salmon at the CVP and SWP facilities

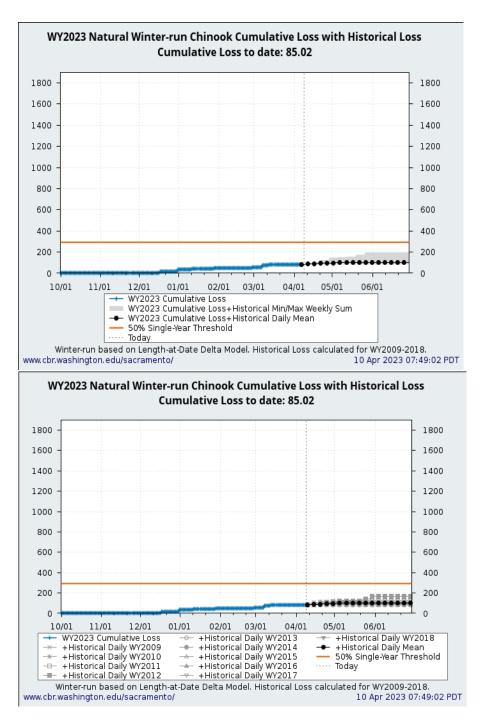

Figure 2. Predicted weekly loss of steelhead and winter-run Chinook salmon at the CVP and SWP facilities

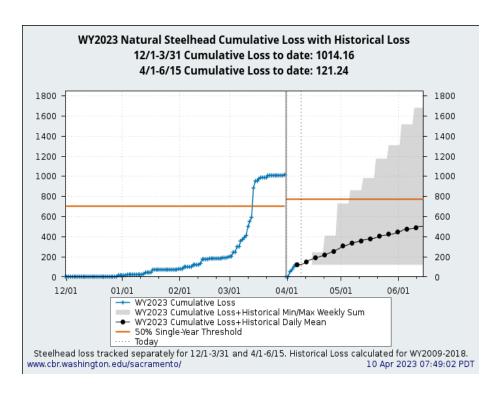

Figure 3. Cumulative natural steelhead loss for the year (blue) and 2009 – 2018 historic cumulative loss (gray, different symbols). Historic daily mean plotted in black circles

# **Evaluation**

1. After January 1, are more than 5% of juveniles from one or more salmonid species present in the Delta?

Greater than 5% of all juvenile salmonids are present in the Delta.

2. Does the operational outlook's ranges impact fish movement and change the potential distribution of fish?

Potential effects within the 7 days (near-term) in the operations outlook.

OMR flow is expected to remain at or more positive than -5,000 cfs this upcoming week. OMR flows more positive than -5,000 cfs are hypothesized to have minimal impact on movement and distribution of salmonids in the South Delta.

Potential effects longer than the 7 days (longer-term) in the operations outlook.

Not applicable, see response above.

3. What is the likelihood of increased loss exceeding the next annual loss threshold (50%, 75% or 90% of threshold) resulting in OMR management actions based on population distribution, abundance, and behavior of fish in the Delta?

#### Winter-run Chinook salmon

Total juvenile natural winter-run Chinook salmon (LAD) loss is 89.02 fish (as of 04/10/2023). No loss of juvenile winter-run LAD Chinook salmon has occurred in the past week at the CVP and SWP fish salvage facilities. Final JPE calculations have been established for brood year (BY) 2022 winter-run Chinook salmon. The agencies in the SaMT assessed the likelihood of exceeding the next annual loss threshold and believe that loss occurring in the next week is unlikely to lead to exceedance of the 50% single-year less threshold (Figures 1 and 2). Based on historical data, >90% of salvage for winter-run LAD Chinook salmon should have occurred at this time of the year (Table 3).

#### Spring-run Chinook salmon

Total natural young of year spring-run Chinook salmon (LAD) loss is 74.02 fish (as of 4/10/2023). Loss of natural juvenile spring-run LAD Chinook salmon has not occurred in the past week at the CVP and SWP fish salvage facilities. 8 genetically confirmed spring-run have been caught in salvage this WY with a total loss of 45.12. Loss for yearling spring-run surrogate has not exceeded the 0.5 % threshold for any release group (refer to Ops Outlook Table 2). The agencies in the SaMT assessed the likelihood of exceeding annual loss threshold and believe that loss occurring in the next week is unlikely to lead to exceeding the hatchery spring-run surrogate threshold.

#### Central Valley Steelhead

Total natural juvenile steelhead loss (April 1 through June 15) is 121.24 fish (as of 4/10/2023). Loss of natural juvenile has occurred in the past week at the CVP and SWP fish salvage facilities. See table 6a for predicted weekly loss of steelhead at the CVP and SWP facilities. The agencies in the SaMT assessed the likelihood of exceeding the 50% annual loss threshold and believe that loss occurring in the next few weeks is unlikely to lead to the exceedance of 50% annual loss threshold (see Figures 1 and 3).

4. If an annual loss threshold has been exceeded, do continued OMR restrictions benefit fish movement and survival based on real-time information?

#### Winter-run Chinook salmon

The annual loss threshold for winter-run Chinook salmon has not been exceeded in WY 2023.

#### Spring-run Chinook salmon

The annual loss threshold for spring-run Chinook salmon has not been exceeded in WY 2023.

#### Central Valley Steelhead

The April 1 – June 15 50% annual loss threshold for steelhead has not been exceeded in WY 2023. The December 1 – March 31 50% annual loss threshold for steelhead (December 1 – March 31) was exceeded in WY 2023 and the 75% annual loss threshold was nearly exceeded; however, the December-March season for steelhead is over.

5. If OMR is more negative than -5,000 cfs, are there changes in spawning, rearing, foraging, sheltering, or migration behavior beyond those anticipated to occur under OMR management at -5,000 cfs?

Expected OMR flows are 10,000 to 13,000 cfs for the next week. Under OMR flows more negative than -5,000 cfs the SaMT expects impacts to rearing, foraging, sheltering, or migration of salmonids present in the south Delta. Salmonid presence in the south Delta is difficult to assess because of limited observations and there is uncertainty in how much of the population might be impacted.

# **Biology Distribution and Evaluation of Green Sturgeon**

#### **Population Status**

- Delta Life Stages:
  - Adults and Juveniles

#### Distribution

#### **Current Distribution**

- Adults: Most abundant during spring spawning migration period of March through May, and post spawning out-migration periods May through June; October through January depending on first winter storm event resulting in significant Sacramento River flow increases. Adult presence year-round to a lesser extent mainly in San Pablo Bay.
- Juveniles: Age-1 through Age-3 juveniles present year-round and widely distributed. Juveniles tagged with acoustic tags in the main channel Sacramento River near Sherman Island detected in the Sacramento River as far upstream as the Cache Slough complex, in the San Joaquin River at the Antioch Bridge, in Threemile, Horseshoe Bend, and Montezuma Sloughs. Seasonal abundance at the primary sampling site (near Sherman Island) appears to be highest during summer in based on capture and telemetry data.

Residence time at the primary sampling site for individual fish ranges from one day to over one year but telemetry data show outmigration from the primary sampling site to the Pacific Ocean ranges from 27 to 552 days. Recent capture data shows diurnal depth preference in the main channel of the Sacramento River. No recent documentation of shallow water habitat presence or foraging but likely.

#### Historical Trends

• Juvenile and adult green sturgeon are historically present in the San Joaquin and Sacramento rivers and Delta

#### Forecasted Distribution within Central Valley and Delta regions

• Juvenile and adult green sturgeon are present in the San Joaquin and Sacramento rivers and Delta during the next week.

## **Evaluation**

1. Is there likely to be salvage that may exceed the annual loss limit?

Green sturgeon salvage is 0 fish (as of 4/11/2023). The agencies in the SaMT assessed the likelihood of salvage occurring in the next week is unlikely to occur.

# Biology, Distribution, and Evaluation of Delta Smelt

#### **Population Status**

- Delta Smelt Life Stages:
  - Adults, larvae
- Brood Year 2022:
- Abundance estimate:
  - The most recent abundance estimate is from March 24, 2023, and was 1,575 (95% CI: 218 to 5,692).
- Biological Conditions:
  - Delta Smelt are spawning and larval Delta Smelt are present. Adult Delta Smelt have not been detected since 3/21/2023. Larval Delta Smelt are expected to be present in the Lower Sacramento, Lower San Joaquin, Suisun Marsh and Suisun Bay, based on the most recent survey detections. The Smelt Monitoring Team discussed the most recent monitoring data (Table 4) and considered published literature and professional judgement on the historical trends in regional distribution.

#### **Distribution**

#### **Current Distribution**

- Real time detection data is currently limited to EDSM, Chipps Island Trawl and SLS; Bay Study, SKT, and 20mm survey provide data as available.
- One marked adult Delta Smelt has been detected by surveys in the Sacramento Deepwater Ship Channel since 3/20/2023.
- One confirmed and five preliminary larval Delta Smelt have been detected by surveys in Suisun Bay, Suisun Marsh, the Lower Sac, and Lower San Joaquin between 3/13/2023-3/15/2023.
- No Delta Smelt have been detected in salvage at the SWP and CVP since 3/2/2023. Cumulative seasonal salvage is 52.
- Experimental release of hatchery Delta Smelt occurred at Rio Vista on November 30, 2022, and January 18-19, 2023, and in the Deepwater Shipping Channel on January 25-26, 2023. Forty-two fish from the experimental release have been caught or salvaged since 12/14/22.
- Larval sampling at the Skinner Fish Facility (SFF) and the Tracy Fish Collection Facility (TFCF) was initiated by the SMT at 0400 on March 1.
- COA 8.5.2: Larvae are present, and the average 12-station Secchi depth is 58 cm.

Table 7. Summary of newly reported detections of Delta Smelt by Region and Salvage Facilities since the last assessment. Regions are those defined by EDSM sampling. Delta Smelt >58mm FL are considered adults. Subadult fish are considered by the SMT to be fish from the previous year's cohort based on size and timing of collection. Young of year are considered juveniles and larvae.

| Life Stage      | North | South | West | Far West | Salvage |
|-----------------|-------|-------|------|----------|---------|
| Adult           | 0     | 0     | 0    | 0        | 0       |
| Subadult        | 0     | 0     | 0    | 0        | 0       |
| Larvae/Juvenile | 0     | 0     | 0    | 0        | 0       |

Table 8. Summary of recent Delta Smelt detections reported since last assessment and the total detections for the current water year. Notes reflect latest information on reported detections or completion of survey for the water year and include both larval and adult detections. Total Fish counts do not distinguish between hatchery origin and wild Delta Smelt. Table indicates detections that have undergone preliminary ID, QA/QC,

and genetic confirmation. Numbers are updated as QA/QC and genetic confirmation become available.

#### **Cultured Delta Smelt Experimental Releases**

- Experimental releases included:
  - 13,140 fish on November 30, 2022,
  - 17,570 fish on January 18-19, 2023, both at Rio Vista,
  - 12,995 in the Sacramento Deep Water Ship Channel.
- Experimental releases are complete.
- Details of Delta Smelt releases are available at: <u>SacPAS: Central Valley Prediction & Assessment of Salmon</u>

Table 9. Weekly summary of the origin of Delta Smelt. These identifications are considered tentative and additional genetic testing will confirm the identity of individuals. Individuals with no tags are provided alive to the FCCL as potential additions to the FCCL Broodstock.

| Date      | Survey | Stratum/Station | Total<br>Caught | Ad.<br>Clipped | VIE | No Tag |
|-----------|--------|-----------------|-----------------|----------------|-----|--------|
| 4/11/2023 | N/A    | N/A             | N/A             | N/A            | N/A | N/A    |

#### **Historical Trends**

• Upstream migration for Delta Smelt occurs between September and December and in response to "first flush" conditions (Sommer et al. 2011, Grimaldo et al. 2009). Migration

- typically ranges one to four weeks after flow and turbidity increases, based on salvage data (Sommer et al. 2011).
- Historically, detections of ripe Delta Smelt began in January and peaked in February and March and the majority of Delta Smelt spawning occurs within a temperature range of 9-18°C (Figure 4; Table 12; Damon et al. 2016).
- Based on historical monitoring data from the past few years (https://github.com/Delta-Stewardship-Council/deltafish), first detection of larvae in the Central and South Delta has typically occurred by mid to late March (https://www.cbr.washington.edu/sacramento/tmp/hrtsalvage\_1676407207\_694.html).
- Salvage data as presented on SacPas indicates that adult Delta Smelt salvage in recent years has reached the 50th percentile at the end of February beginning of March.
- Historically, the highest peak in salvage is in May and the second highest is in June (Grimaldo et al 2009).

#### Forecasted Distribution within Central Valley and Delta regions

- Predicting the distribution of Delta Smelt is currently difficult because detection data is limited to a few wild individuals and historic patterns may not be representative of the low population levels.
- The SMT uses turbidity as a surrogate for Delta Smelt presence and in making assessments of the likelihood of entrainment for larval Delta Smelt after spawning begins.
- The potential of experimentally released Delta Smelt to distribute from their release site is unknown at this time and SMT cannot predict their distribution beyond the original release site and subsequent recaptures. There is a high degree of uncertainty regarding the response of cultured fish to environmental cues typically applied to wild Delta Smelt.

## **Abiotic Conditions**

#### **Turbidity**

- Mostly sunny this week with relatively warm temperatures. In Stockton, winds are
  forecast to be W then NW at 9-16 mph with gusts up to 21 mph through Thursday. In
  Antioch, winds are forecast to be W then NW at 7-18 mph with gusts up to 22 mph
  through Thursday
- Turbidity is below 12 FNU at OBI but remains above 12 FNU at some South Delta stations. Turbidity is expected to continue to decrease over the next week.

Table 10. Relevant Environmental Factors to the current management actions for Delta Smelt.

|               | SJJ 3-day Average Water |                          |
|---------------|-------------------------|--------------------------|
|               | temperature             | 20 mm 2 Avg Secchi Depth |
| Date Reported | (°C)                    | (m)                      |
| 4/9/2023      | 13.8                    | 0.58*                    |

<sup>\*</sup>Data from 3/27/2023-3/28/2023

#### X2 Conditions

- As of 4/10/2023, X2 is estimated to be well west of Martinez (< 56 km).
- When X2 is above 81 km, the SMT uses the X2\_EC\_Graph.xlxs tool to estimate the position of X2 for both the Sacramento and San Joaquin Rivers and assumes the average of the two is representative of an approximate X2 position.

#### **Other Environmental Conditions**

- The Fish and Water Operation Outlook OMR Index values are expected to range between +10,000 to +13,000 cfs from 4/11/2023 to 4/17/2023.
- QWEST was estimated at 36,450 cfs on 4/10/2023 and is expected to remain very positive but decrease this week.
- Water temperature at Rio Vista was 13.4°C and at Antioch 14.0°C on 4/9/2023.
- Real time tracking of environmental conditions, relevant thresholds and Delta Smelt catch data are updated daily at: http://www.cbr.washington.edu/sacramento/workgroups/delta smelt.html.

#### **Evaluation**

#### **USBR and DWR Proposed Operations:**

- 4/11 4/17: The 3-day average water temperature at Jersey Point is greater than 12 degrees Celsius and the average Secchi depth at the 12 central and south Delta stations is less than 1 meter, requiring a 7-day average OMR index limit of less negative than or equal to -3,500 cfs for larval Delta smelt protection under the amended ITP COA 8.5.2. Due to very high flows, the Bay/Delta is in excess conditions and the OMRI limit is not controlling exports.
- Interim Operations have been adopted. USBR will be adhering to ITP Protections for Larval & Juvenile Delta Smelt (COA 8.5.2) or the PA's Larval and Juvenile Smelt Protections, whichever is more protective.
- 1. Between December 1 and January 31, has any first flush condition been exceeded?

First flush conditions based on running 3-day average flow and running 3-day average turbidity at Freeport were met on December 31, 2022, triggering IEWPP regulations. The CVP and SWP reduced exports beginning on 1/3/2023 through 1/16/2023.

2. Do DSM have a high risk of migration and dispersal into areas at high risk of future entrainment? (December 1- January 31)

This is no longer applicable.

3. Has a spent female been collected?

A spent female has not been collected, but two cultured ripe females were caught by SKT on 2/8/2023. Some of the fish released in January were observed to be ripe and releasing eggs upon release. This could be due to warmer water temperatures at culture facilities, or due to stress from releases.

4. If OMR of -2000 cfs does not reduce OBI turbidity below 12NTU/FNU, what OMR target is deemed protective between -2000 and -5000 cfs?

This question is not applicable as the turbidity bridge avoidance action was offramped starting 2/9/2023 with the capture of two ripe, marked female Delta Smelt.

5. If OBI is 12 NTU/FNU, what do other station locations show?

This question is not applicable as the action was off-ramped starting 2/9/2023 with the capture of two ripe, marked female Delta smelt.

6. If OBI is 12 NTU/FNU, is a turbidity bridge avoidance action not warranted? What is the supporting information?

This question is not applicable as the action was off-ramped starting 2/9/2023 with the capture of two ripe, marked female Delta smelt.

7. After March 15 and if QWEST is negative, are larval or juvenile DSM within the entrainment zone of the CVP and SWP pumps based on surveys?

QWEST is positive and anticipated to remain positive through the week. One confirmed and five preliminary larval DSM were detected 3/13/2023-3/15/2023 outside of the entrainment zone.

8. Based on real-time spatial distribution of Delta Smelt and currently available turbidity information, should OMR be managed to no more negative than -3,500?

Turbidity and temperature conditions: On 4/10/2023, 20 mm Survey #3 mean Secchi depth at the South Delta stations was below 1m (0.58m). Mean Secchi depth across strata (EDSM) between 4/3/2023 and 4/10/2023 was 0.49m, and mean Secchi depth in the South Delta was 0.86m. The 3-day mean water temperature at Jersey Point exceeded 12°C on 3/18/23.

Real-time biological conditions: One confirmed and five preliminary larval DSM were detected 3/13/2023-3/15/2023 outside of the entrainment zone.

Current OMRI management: Yes, larval protection of an OMRI no more negative than -3500 cfs was triggered on 3/18/2023 and continues to be triggered based on temperature and Secchi depth data.

9. What do hydrodynamic models, informed by EDSM or other relevant data, suggest the estimated percentage of larval and juvenile DSM that could be entrained may be?

OMRI values are anticipated to be between +10,000 cfs and +13,000 cfs throughout the week. Daily and 3-day average water temperatures remain above 12° C at multiple stations. The majority of spawning typically occurs between 11-14° C (Damon et al. 2016; Attachment A, Figure 4). Based on detections in salvage, adult fish were in the South Delta and may have spawned there. Spawning is ongoing, and one confirmed and five preliminary larvae have been detected outside of the entrainment zone. The likelihood of larval DSM entrainment is low, given highly positive OMRI and QWEST values.

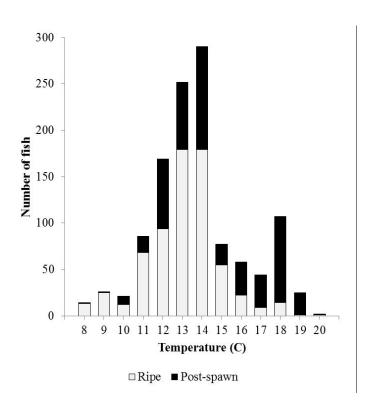

Figure 4. The number of ripe (grey) or post-spawn (black) delta smelt caught in a specific temperature range during routine monthly sampling in the upper San Francisco Estuary during January-May for years 2002-2015 (Figure 8 from Damon et al. 2016).

Table 12. Number and size range (mm FL) of near-ripe female delta smelt on their first or subsequent clutch of eggs by month of collection. Delta smelt were used in this study's fecundity analysis and collected during routine monthly sampling during January-May for years 2012-2015 (Table 3 from Damon et al. 2016).

| Month    | First      | Subsequent | Total      |
|----------|------------|------------|------------|
| January  | 2 (72-73)  | 0          | 2 (72-73)  |
| February | 41 (56-84) | 2 (65-85)  | 43(56-85)  |
| March    | 37 (63-77) | 5 (63-81)  | 42 (63-81) |
| April    | 6 (62-82)  | 9 (65-90)  | 15 (62-90) |
| May      | 7 (68-78)  | 20 (69-83) | 27 (68-83) |
