

**APPENDIX A**  
**Test Borings and Field Exploration Program**

## A.1 Field Exploration Program

Our field exploration program consisted of drilling thirty-seven (37), 6-inch-diameter geotechnical test borings to obtain data necessary to evaluate subsurface conditions for the proposed project. The approximate boring locations, designated SB-1 through SB-34 and SB-38 through SB-40, are presented on Figures 3 through 8. It is noted that Borings SB-35 through SB-37, originally planned along the Cassady Lateral, have been eliminated from our scope of work since improvements to this lateral are no longer proposed. The elevations presented on the boring logs are relative to NAVD 88 and based on a topographic survey performed by R.E.Y. Engineers under contract with Provost & Pritchard.

Our investigation also included the construction of six (6), 13-foot-deep piezometers, designated BEL2, BEL5, SCH2, TRA2, TRA4, and TRA6, shown on Figures 3 through 8. Three of the piezometers (BEL2, BEL5, and SCH2) were constructed adjacent to borings and were not sampled and logged separately. The remaining piezometers are not near borings and were therefore drilled, sampled and logged separately as additional borings. Upon drilling of the boring, the piezometer components were placed. The components consisted of 2-inch diameter Monoflex (Campbell Mfg.) Schedule 40 flush thread slotted (0.02" wide – 1/8" spacing) PVC pipe for the lower 10 feet; solid Monoflex casing for the upper 3 feet; 3/8"-minus aggregate in the annulus around the slotted portion; hydrated bentonite chips around the solid portion; a surface-mounted monument cover set in concrete; and a threaded cap on the bottom of the pipe and a locking cap on the top.

Prior to the start of drilling, SAGE obtained a drilling permit from the Butte County Public Health - Environmental Health Division (BCPH) and notified Underground Services Alert (USA) at least 48 hours prior to the start of work. Furthermore, borings near county roads, railroads, and apparent utilities were cleared by Cruz Brothers, a private utility locator subcontracted to SAGE.

The borings and piezometers were completed between July 19, 2011 and August 10, 2011. The borings and piezometers were drilled by RSI Drilling using a truck-mounted CME-75 drill rig equipped with six-inch-diameter hollow-stem augers. The exceptions are two piezometers, TRA6 and BEL5, which were drilled using a track-mounted Geoprobe 6620DT drill rig. The borings were drilled to depths ranging from 26.5 to 51.5 feet below the existing ground surface. During drilling, an engineer logged the materials encountered and obtained representative samples for visual classification and laboratory testing. The materials encountered were classified in general accordance with the Unified Soil Classification System (USCS) as summarized on Figure A-1. Logs for borings B-1 through B-34 and B-38 through B-40 are presented as Figures A-2 through A-41.

Representative soil samples for this investigation were recovered using the following sampler types:

- Modified California (MCA) split-barrel sampler with a 3.0-inch-outside diameter fitted with 2.43-inch-inside-diameter, six-inch-long brass liners;
- California (CA) split-barrel sampler with a 2.5-inch-outside diameter fitted with 1.93-inch-inside-diameter, six-inch-long brass liners;
- Standard Penetration Test (SPT) split-barrel sampler with a 2.0-inch-outside diameter, without liners; and
- Thin-walled Shelby tube (30-inch length) sampler with a 3.0-inch-nominal diameter.

The split-barrel samplers were driven with a 140-pound, automatic trip hammer falling 30 inches; the Shelby tubes were pushed hydraulically. The blow counts required to drive the split-barrel samplers over a standard 18-inch-drive were recorded in six-inch increments in the field. Where refusal was encountered (defined as greater than 50 blows over any six-inch increment) drive lengths less than 12 inches were also recorded. The final 12-inches of the drive (less in the case of refusal) were added to develop the reported blow count. The blow counts for the CA and MCA samplers were corrected for the effects of sampler size and converted to SPT N values using conversion factors of 0.85 and 0.65, respectively. Because an automatic trip hammer was used, the corrected CA and MCA blow counts, as well as the raw SPT blow counts, were also corrected for the effects of hammer energy using an additional conversion factor of 1.3 (assuming about 80% efficiency). The final, corrected values for each drive are presented on the boring logs and represent  $N_{60}$  values.

Upon completion of the borings, the holes were backfilled with cement grout in accordance with BCPH requirements and were inspected by a Butte County inspector. The soil cuttings were spread out on the ground adjacent to the boring locations.

## UNIFIED SOIL CLASSIFICATION SYSTEM

Major Divisions		Symbols	Typical Names
Coarse-Grained Soils (more than half of soil ^ No. 200 sieve size)	Gravels (More than half of coarse fraction > No. 4 sieve size)	GW	Well-graded gravels or gravel-sand mixtures, little or no fines
		GP	Poorly-graded gravels or gravel-sand mixtures, little or no fines
		GM	Silty gravels, gravel-sand-silt mixtures
		GC	Clayey gravels, gravel-sand-clay mixtures
	Sands (More than half of coarse fraction > No. 4 sieve size)	SW	Well-graded sands or gravelly sands, little or no fines
		SP	Poorly-graded sands or gravelly sands, little or no fines
		SM	Silty sands, sand-silt mixtures
		SC	Clayey sands, sand-clay mixtures
Fine-Grained Soils (more than half of soil < No. 200 sieve size)	Silts and Clays LL = < 50	ML	Inorganic silts and clayey silts of low plasticity, sandy silts, gravelly silts
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, lean clays
		OL	Organic silts and organic silt-clays of low plasticity
	Silts and Clays LL = > 50	MH	Inorganic silts of high plasticity
		CH	Inorganic clays of high plasticity, fat clays
		OH	Organic silts and clays of high plasticity
	Highly Organic Soils	PT	Peat and other highly organic soils

### GRAIN SIZE CHART

Classification	Range of Grain Sizes	
	U.S. Standard Sieve Size	Grain Size in Millimeters
Boulders	Above 12"	Above 305
Cobbles	12" to 3"	305 to 76.2
Gravel coarse fine	3" to No.4 3" to 3/4" 3/4" to No. 4	76.2 to 4.76 76.2 to 19.1 19.1 to 4.76
Sand coarse medium fine	No. 4 to No. 200 No. 4 to No. 10 No. 10 to No. 40 No. 40 to No. 200	4.76 to 0.074 4.76 to 2.00 2.00 to 0.420 0.420 to 0.074
Silt and Clay	Below No. 200	Below 0.074

### TYPES OF STRENGTH TESTS

PP	Pocket Penetrometer
TV	Field Torvane
LVS	Laboratory Vane Shear
UC	Unconfined Compression
TXUU	Triaxial, unconsolidated, undrained
DS	Direct Shear

▽ Unstabilized (initial) groundwater level

▼ Stabilized groundwater level

### SAMPLER TYPE

C		Core barrel		CME Continuous Sample		Standard Penetration Test (SPT) split-barrel sampler with a 2.0-inch outside diameter and a 1.5-inch inside diameter
O		Osterberg piston sampler using 3.0-inch outside diameter, thin-walled Shelby tube		Disturbed grab sample		Sampling attempted without recovery
PT		Pitcher tube sampler using 3.0-inch outside diameter, thin-walled Shelby tube		California split-barrel sampler with 2.5-inch outside diameter and 1.93-inch inside diameter		
ST		Shelby tube (3.0-inch outside diameter, thin-walled tube) advanced with hydraulic pressure		Modified California split-barrel sampler with 3.0-inch outside diameter and 2.5-inch inside diameter		
NOTE: Shaded portion of sampler symbol represents portion of sample recovered
