## Appendix 9E

## Weighted Useable Area Analysis

This appendix provides information about the methods and assumptions used for the Remanded Biological Opinions on the Coordinated Long-Term Operation of the Central Valley Project (CVP) and State Water Project (SWP) Environmental Impact Statement (EIS) analysis. It is organized in the following sections:

- Section 9E.1.1: Methodology
- The fish and aquatic resources impacts analysis used weighted useable area (WUA) as a metric for evaluating changes in physical habitat related to flow. This section describes the overall analytical approach and assumptions. The following species are analyzed in this appendix:
- Clear Creek Spring-run Chinook Salmon
- Clear Creek Fall-run Chinook Salmon
- Clear Creek Steelhead/Rainbow Trout
- Sacramento River Fall-run Chinook Salmon
- Sacramento River Late-Fall-run Chinook Salmon
- Sacramento River Winter-run Chinook Salmon
- Sacramento River Steelhead/Rainbow Trout
- Lower Feather River Fall-run Chinook Salmon
- Lower Feather River Steelhead
- Lower American River Fall-run Chinook Salmon
- Lower American River Steelhead
- Section 9E.1.2: Assumptions
- This section provides a brief description of the assumptions for the WUA analysis for simulations of the No Action Alternative, Second Basis of Comparison, and other alternatives.
- Section 9E.2: Weighted Useable Area-Discharge Relationships
- This section presents the WUA-discharge relationships that served as the basis for evaluating changes in habitat related to flow.
- Section 9E.3: Results
- This section presents the WUA values generated for each water body, species, and life stage evaluated.

## 9E. 1 Methodology and Assumptions

## 9E.1.1 Methodology

To compare the operational flow regime and evaluate the potential effects on habitat for anadromous species inhabiting streams, the relationships between
streamflow and habitat availability were determined for each life stage of these species in the rivers in which flows may be altered by CVP and SWP operations.

Several studies have been conducted using the models and techniques contained within the Instream Flow Incremental Methodology (IFIM) to establish these relationships in streams within the study area. The analytic variable provided by the IFIM is total habitat, in units of WUA, for each life stage (fry, juvenile, and spawning) of each evaluation species (or race as applied to Chinook Salmon). Habitat (WUA) incorporates both macro- and microhabitat features. Macrohabitat features include changes in flow, and microhabitat features include the hydraulic and structural conditions (depth, velocity, substrate, or cover) affected by flow, which define the actual living space of the organisms. The total habitat available to a species/life stage at any streamflow is the area of overlap between available microhabitat and macrohabitat conditions. Because the combination of depths, velocities, and substrates preferred by species and life stages varies, WUA values at a given flow differ substantially for the species and life stages evaluated.

WUA-flow relationships have been developed for only some of the rivers where simulated flows were available. Therefore, flow-dependent habitat availability was evaluated quantitatively only for Clear Creek and the Sacramento, Feather, and American rivers and was not reported for other rivers evaluated in this EIS. Tables of the spawning habitat-discharge relationships used in the calculations of spawning WUA for these rivers are listed in Section 9E.3. Because the WUAflow relationships developed by the most recent IFIM studies present WUA values within particular flow ranges at variable steps, the monthly flow for a particular reach often fell between two flows for which there were WUA values. In these cases, the value was determined by linear interpolation between the available WUA values for the flows immediately below and above the target flow. When the target flow was lower than the lowermost flow for which a WUA value exists, the corresponding WUA value was determined by linear interpolation between a flow of zero and the lowermost flow for which a WUA value exists. When the target flow was higher than the highest flow for which a WUA value exists, the corresponding WUA value was determined by assuming the WUA value for the highest flow.

WUA tables are available for three segments of Clear Creek: the Upper Alluvial Segment (Whiskeytown Dam to Camp Bridge); Canyon Segment (Camp Bridge to Clear Creek Road Bridge); and Lower Alluvial Segment (Clear Creek Road Bridge to Sacramento River). Spring-run Chinook Salmon spawn in the upper two segments, fall-run Chinook Salmon spawn in the lower segment, and Steelhead/Rainbow Trout spawn in all three segments. Spring-run Chinook Salmon and Steelhead fry and juveniles rear in all three segments, while fall-run Chinook Salmon rear in the lower segment. The relationships between WUA and flow in all of these segments for each of these species and life stages are based upon the flow released below Whiskeytown Dam and are described in USFWS (2007, 2011a, 2011b, 2013). For this analysis, if the WUA values for a species and life stage were in the upper section only, the upper two segments were
combined for an upper Clear Creek total WUA value at each flow. The same approach was done for the lower segment. If the species and life stage spanned the entire Clear Creek, WUA values were combined for the three segments to provide an estimate of the total WUA available at each flow.

WUA tables are available for two segments of the Sacramento River: Keswick Dam to Battle Creek and Battle Creek to Deer Creek. Spring-run and fall-run Chinook Salmon and Steelhead spawn only in the upper segment; fry and juveniles rear in both segments. Each of these segments have multiple reaches identified and for which WUA was calculated (USFWS 2005a, 2005b, 2006). For this analysis, WUA estimates in each reach between Keswick Dam and Battle Creek were combined into an estimate of the total amount of habitat available in that river segment. Similarly, WUA estimates for reaches between Battle Creek and Deer Creek were combined into an estimate of the total amount of WUA available in that river segment.

For the American River, WUA estimates were available only for fall-run Chinook Salmon and Steelhead spawning. USFWS (2003) identified five reaches between Sailor Bar (River Mile [RM] 22.1) and Rossmoor (RM 16.6). The relationships between WUA and flow in all of these reaches was based upon the flow released below Nimbus Dam. For this analysis, WUA estimates within the five reaches were combined into an estimate of the total WUA in the American River at a given flow released from Nimbus Dam.

For the Feather River, WUA estimates are available for spring-run and fall-run Chinook Salmon and Steelhead spawning in two reaches: the low-flow channel from the fish barrier dam (RM 67) to the Thermalito Afterbay outlet (RM 59) and the lower Feather River high-flow channel from the Thermalito Afterbay outlet to Honcut Creek (RM 44). The relationship between WUA and flow in these reaches for each of these species is described in DWR (2004). The WUA-flow relationships developed by DWR (2004) are based upon the merging of IFIM data collected by DWR in 1992 and reviewed by DWR (2002), with new depth, velocity, substrate, and cover data collected along supplemental Physical Habitat Simulation System (PHABSIM) cross-section transects in 2002 and 2003. For this analysis, WUA estimates within the two reaches were kept separate, and estimates of WUA in each reach were based upon the different flows in each reach.

WUA values were calculated and presented only on a monthly time-step, and not as seasonal or annual values. WUA values based on the monthly CalSim II flows were prepared for detailed evaluation of the alternatives. Monthly WUA values are presented as the average total WUA in each river segment, for the entire 82-year simulation period and the average total WUA in each of five water year types for each alternative. Differences between the alternatives and the two bases of comparison (No Action Alternative and Second Basis of Comparison) were used to identify the effects of each alternative on habitat availability (WUA) for each species and life stage in each river. These comparisons were made only for the months in which the species and life stage were anticipated to be present in each river.

The ability to estimate WUA values is limited because of the monthly time-step of the CalSim II results. The monthly time-step is most limiting during the fall through spring seasons, when flows vary significantly on a daily basis because of hydrologic conditions. Hydrologic variability in the runoff and tributary flows cause significant variability of flows in the areas of interest for the WUA computations. During the periods of low flows, regulated flows from reservoir releases dampen the impact of daily variability of flows on WUA estimates. Monthly time-step simulation results do not capture the daily variability or change in variability between alternative operations. Nonetheless, these estimates provide an indication of the habitat differences among the alternative operational scenarios evaluated.

## 9E.1.2 Assumptions

Assumptions for the WUA analysis for the No Action Alternative, Second Basis of Comparison, and other alternatives were developed with the surface water modeling tools and are described in Appendix 5A, Section B.

The following CalSim II model simulations were performed as the basis of evaluating the impacts of the other alternatives:

- No Action Alternative
- Second Basis of Comparison

The following model simulations of other alternatives were performed:

- Alternative 1 - for simulation purposes, considered the same as Second Basis of Comparison
- Alternative 2 - for simulation purposes, considered the same as No Action Alternative
- Alternative 3
- Alternative 4 - for simulation purposes, considered the same as Second Basis of Comparison.
- Alternative 5

Alternative 1 modeling assumptions are the same as the Second Basis of Comparison, and Alternative 2 modeling assumptions are the same as the No Action Alternative; therefore, the assumptions for those alternatives are not discussed separately in this document.

Assumptions for each of these alternatives are reflected to monthly CalSim II flows that are used in the WUA analysis described in this section. The WUA area-discharge relationships described below pertain to all alternatives.

## 9E. 2 Weighted Useable Area-Discharge Relationships

The WUA-discharge relationships (WUA curves) used for the analysis are presented at the end of this appendix by river reach and species. The "total"
column represents the relationship that was used to calculate the WUA for each species and life-stage. Adjustments were made to the WUA relationship by adding a minimum and a maximum value at the first and last row of each table to make the interpolation scheme function.

## 9E. 3 Results

The results of the WUA analysis are presented in the tables listed below. The tables show monthly WUA in acres for each river reach and fish species (as described in Section 9E.1.1) with monthly exceedance probabilities and long-term and water year type averages over the 82 -year CalSim II simulation period. The tables also present the incremental difference in WUA for each alternative as compared to the No Action Alternative and the Second Basis of Comparison.

The results are presented in the following tables at the end of this appendix:

- C.1. Upper Clear Creek Spring-run Spawning WUA
- C.2. Total Clear Creek Spring-run Fry Rearing WUA
- C.3. Total Clear Creek Spring-run Juvenile Rearing WUA
- C.4. Lower Clear Creek Fall-run Spawning WUA
- C.5. Lower Clear Creek Fall-run Fry Rearing WUA
- C.6. Lower Clear Creek Fall-run Juvenile Rearing WUA
- C.7. Total Clear Creek Steelhead/Rainbow Trout Spawning WUA
- C.8. Total Clear Creek Steelhead/Rainbow Trout Fry Rearing WUA
- C.9. Total Clear Creek Steelhead/Rainbow Trout Juvenile Rearing WUA
- C.10. Sacramento River Battle Creek to Deer Creek Fall-run Spawning WUA
- C.11. Sacramento River Keswick to Battle Creek Fall-run Spawning WUA
- C.12. Sacramento River Keswick to Battle Creek Fall-run Fry Rearing WUA
- C.13. Sacramento River Keswick to Battle Creek Fall-run Juvenile Rearing WUA
- C.14. Sacramento River Keswick to Battle Creek Late-Fall-run Spawning WUA
- C.15. Sacramento River Keswick to Battle Creek Late-Fall-run Fry Rearing WUA
- C.16. Sacramento River Keswick to Battle Creek Late-Fall-run Juvenile Rearing WUA
- C.17. Sacramento River Keswick to Battle Creek Winter-run Spawning WUA
- C.18. Sacramento River Keswick to Battle Creek Winter-run Fry Rearing WUA
- C.19. Sacramento River Keswick to Battle Creek Winter-run Juvenile Rearing WUA
- C.20. Sacramento River Keswick to Battle Creek Steelhead Spawning WUA
- C.21. Feather River Low Flow Channel Steelhead Spawning WUA
- C.22. Feather River below Thermalito Steelhead Spawning WUA
- C.23. Feather River Low Flow Channel Fall-run Spawning WUA
- C.24. Feather River below Thermalito Fall-run Spawning WUA
- C.25. American River below Nimbus Fall-run Spawning WUA
- C.26. American River below Nimbus Steelhead Spawning WUA

a Exceedance probability is defined as the probability a given value will
be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year
Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and № Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

[^0]1) Al allemaives are simulated win projected hydrology and sea level ar Year 2030 conditions. 2) Model results for Alle maives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented Qualitative differences, if appicable, are discussed in the text. 3) Model resuits for Atternative 2 and No Action Atternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Exceedance probability is defined as the probability a given value will be exceeded in any one year.
based on the 82 -year simulation period
As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
SWRCB D-1641, 1999): projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and econd Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are iscussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
Based on the 82 -year simulation period
As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
SWRCB D-1641, 1999): projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Altematives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Exceedance probability is defined as the probability a given value will be
xceeded in any one year.
Based on the 82 -year simulation period
As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrolog
Classification (SWRCB D-1641, 1999); projected to Year 2030,
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Mode results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results re not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative ifferences, if applicable, are discussed in the text

a Exceedance probability is defined as the probability a given value will be exceeded
in any one year.
$b$ Based on the 82 -year simulation period
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for
Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030

a Exceedance probabiily is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probabiily is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Exceedance probability is defined as the probability a given value will be exceeded in any one year
As defined by the Sater Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030

Notes: 1) All aternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text

Exceedance probability is defined as the probability a given value will be exceeded in any one year
As defined by the Sater Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030

Notes: 1) All aternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text

Exceedance probability is defined as the probability a given value will be exceeded in any one year
Based on the 82 -year simulation period.
cAs defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
SWRCB D-1641, 1999); projected to Year 2030

Notes. 1) Al alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2 ) Model resulis for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and № Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Exceedance probability is defined as the probability a given value will be exceeded in any one year
$b$ Based on the 82 -year simulation period
cAs defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
SWRCB D-1641, 1999); projected to Year 2030

Notes. 1) Al atiernatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model resulis for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030

Notes. 1) All altematives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030

Notes. 1) All altematives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model resuits for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded
in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for
Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Altemative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and № Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value
will be exceeded in any one year.
Based on the 82 -year simulation period
As defined by the Sacramento Valley 40-30-30 Index Water Yea
Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030

Notes: 1) Al alternatives are simulated with projected hydrology and sea level at Year 2030 condition.
2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and № Action Alternative are the same, herefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Exceedance probability is defined as the probability a given value
will be exceeded in any one year.
based on the 82 -year simulation period
As defined by the Sacramento Valley 40-30-30 Index Water Yea
Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
tes: 1) All alternatives are simulated with projected hydrology and sea lever 2030 condition 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the ext. 3) Model results for Alternative 2 and № Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
Based on the 82 -year simulation period
As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
SWRCB D-1641, 1999): projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Altematives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative
differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 esults are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
Based on the 82 -year simulation period
As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999): projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Altermatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999): projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Exceedance probability is defined as the probability a given value will be exceeded in any one year.
Based on the 82 -year simulation period.
As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Secon Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3 Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Exceedance probability is defined as the probability a given value will be exceeded in any one year.
Based on the 82 -year simulation period
As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Secon Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3 Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

| Above Normal (16\%) | -717 | -481 | -162 | -529 | 16 |
| Below Normal (13\%) | -126 | 64 | -920 | 10 | 331 |
| Dry (24\%) | -46 | 5 | 28 | -327 | 30 |
| Critical (15\%) | -203 | -313 | 37 | 1 | 3,888 |

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented Qualitative differences, if applicable, are discussed in the text.

| Dry (24\%) | 0 | 0 | 0 | 0 | 0 |
| Critical (15\%) | 0 | 0 | 0 | 0 | 0 |

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented Qualitative differences, if applicable, are discussed in the text.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Exceedance probability is defined as the probability a given value will be
exceeded in any one year.
b Based on the 82 -year simulation period.
As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic
Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Mode results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results
 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
(SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented Qualitative differences, if applicable, are discussed in the text.

    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic
    Classification (SWRCB D-1641, 1999); projected to Year 2030.
    Notes: 1) Al alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model resulis for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, applicable, are discussed in the text.

[^20]:    Exceedance probabiity is defined as the probability a given value will be exceeded in
    any one year.
    b Based on the 82 -year simulation period
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic
    Classification (SWRCB D-1641, 1999); projected to Year 2030.
    Notes. 1) Al alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model resulis for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the tex.

[^21]:    Exceedance probability is defined as the probability a given value will be exceeded in
    any one year.
    b Based on the 82 -year simulation period
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic
    Classification (SWRCB D-1641, 1999); projected to Year 2030.
    Notes. 1) Al alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model resulis for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text

[^22]:    Exceedance probability is defined as the probability a given value will be exceeded in
    any one year.
    b Based on the 82 -year simulation period
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic
    Classification (SWRCB D-1641, 1999); projected to Year 2030.
    Notes. 1) Al alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model resulis for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, in applicable, are discussed in the text

[^23]:    Exceedance probability is defined as the probability a given value will be exceeded in any one yea
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
    (SWRCB D-1641, 1999): projected to Year 2030.

[^24]:    Exceedance probability is defined as the probability a given value will be exceeded in any one yea
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
    (SWRCB D-1641, 1999): projected to Year 2030.

[^25]:    a Exceedance probability is defined as the probability a given value will be exceeded
    in any one year.
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification
    (SWRCB D-1641, 1999); projected to Year 2030
    Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

[^26]:    a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
     differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and $N o$ Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

[^27]:    a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
     discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

[^28]:    a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
     discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

[^29]:    a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
     discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

[^30]:    a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
     discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

[^31]:    a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
     discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

[^32]:    a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
    Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

[^33]:    a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

[^34]:    a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

[^35]:    a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

[^36]:    a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

[^37]:    a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
    b Based on the 82 -year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
