## Appendix 5B

## Sensitivity Analysis on Representation of EID's Warren Act and EDCWA's Water Service Contracts with Reclamation in Alternatives 3 and 5

#### Abstract

During internal review of the CalSim II models, it was discovered that the demands for the El Dorado Irrigation District (EID) and El Dorado County Water Agency (EDCWA) contracts were not included in Alternatives 3 and 5, as intended. In an effort to address this oversight, this appendix provides information on and findings from a sensitivity analysis of potential effects of including EID's Warren Act contract and EDCWA's water service contract with Reclamation. The sensitivity analysis includes system operations (CalSim II) and temperature (HEC-5Q) model runs with inclusion of these demands at Folsom Lake. It is apparent from this analysis that inclusion of these contracts would not change the previous conclusions in Chapters 5 through 21.

The following summary focuses on the differences seen within Folsom Lake and the American River. As will be discussed further in this appendix, addition of these demands did not show sensitivity to the rest of the CVP and SWP system and no further model simulations were necessary to capture potential effects.

## 5B. 1 Background

This section provides brief background on EID and EDCWA's Warren Act contracts with Reclamation.

## EID Power to Consumptive Use Transfer and Warren Act Contract

EID has requested to execute a Warren Act contract with Reclamation for use of Folsom Reservoir to convey 17,000 acre-feet annually of non-Central Valley Project (CVP) water from EID's El Dorado Hydroelectric Project (FERC Project 184); a 20 megawatt power project with four small storage reservoirs providing flows to the South Fork of the American River. The Contract was originally negotiated and completed in 2005, but was not executed because of potential operational impacts and difficulties in securing concurrence from the National Marine Fisheries Service (NMFS) that this action is "not likely to adversely affect" threatened and endangered species. In 2014, the Section 7 consultation for the EID Warren Act contract was completed with NMFS. The Section 7 consultation allowed EID to transfer up to 7,500 AF without a temperature control device (to target warmer diversions) and could transfer the full volume of 17,000 AF after construction and implementation of a temperature control device.

Execution of the contract will result in the diversion of flow out of Folsom
Reservoir. Due to the anticipated effect of this reduction in historical inflow, the depletion of Folsom inflow was accounted for in the 2008 Biological Assessment future conditions modeling, but not referenced in the proposed action.

## El Dorado County Water Agency Water Service Contract

Public Law 101-514, Section 206(b) (1) (B) directed the Secretary to enter into a M\&I water supply contract with EDCWA for up to $15,000 \mathrm{AF}$ of CVP water diverted from Folsom Reservoir.

## 5B. 2 Methodology

CalSim II model simulations of Alternatives 3 and 5 were rerun with inclusion of these Warren Act contracts (specifically CalSim II parameters: dem_dsa70_pmi, np_dr70_imi, prj_dr70_imi, DEM_D8F_WR_ANN, DEM_D8I_PMI_ANN, EIDorIDPL table values) as diversions from Folsom Lake. Subsequently, HEC-5Q temperature model was rerun for the American River. The results of Alternatives 3 and 5 are compared with and without representation of the Warren Act and water service contracts. The comparisons represent the changes solely due to inclusion of these diversions at the Folsom Lake.

## 5B. 3 Results

This section presents select CalSim II model results and American River temperature model results.

Results for Shasta, Trinity and Oroville show that changes in reservoir storage were less than $2 \%$ by month and when averaged by water year types. This minor change was considered minor and not substantial to the system outside of the American River basin. These results were consistent for both Alternative 3 and Alternative 5.

Folsom Storage showed a less than 3\% difference when averaged by water year types, but larger differences between 3-6\% were seen in month to month comparisons. Although this is slightly higher than the differences seen elsewhere in the system, the new values do not change any of the conclusions presented in Chapters 5 through 21. Results at Folsom were similar for both Alternative 3 and Alternative 5.

American River flows showed the most difference with reductions in the drier water years. Alternative 3 shows more differences than Alternative 5 with differences as high as $6 \%$ in August of critical years. Although these results show some differences with inclusion of the contracts, these new values do not change any of the conclusions presented in Chapters 5 through 21.

American River temperatures below Nimbus Dam and at Watt Avenue for Alternative 5 showed a slight decrease in October of the drier years, but was within $5 \%$ when averaged by water year type. Although these results show some improvement in temperature with inclusion of the contracts, these new values do not change any of the conclusions presented in Chapters 5 through 21.
Alternative 3 did not show any differences above $1 \%$ with the inclusion of these contracts.

Temperature threshold exceedances in the American River show 1 to 2\% differences in Alternatives 3 and 5 with and without inclusion of the EID and ECWA diversions; which is considered similar in this EIS.
These results confirm that inclusion of EID's Warren Act contract and ECWA's water service contract that result in increased diversions from Folsom Lake do not cause many changes greater than $5 \%$ in model results and hence do not change any of the conclusions presented in Chapters 5 through 21.
The following results for Alternatives 3 and 5 are presented:

> 5B.3.1 Trinity Storage

5B.3.2. Shasta Storage
5B.3.3. Oroville Storage
5B.3.4. Folsom Storage
5B.3.5. Folsom Elevation
5B.3.6. American River below Nimbus Flow
5B.3.7. Sacramento River at Freeport Flow
5B.3.8. Delta Outflow
5B.3.9. Jones and Banks Export Volume
5B.3.10. American River below Nimbus Temperature
5B.3.11. American River at Watt Temperature
5B.3.12. American River at Mouth Temperature
5B.3.13 Temperature Threshold Exceedances - American River

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

## Appendix 5C

## Revised Second Basis of Comparison

A CalSim II model error was identified in New Melones operations in the Second Basis of Comparison simulation. The model error is due to use of an incorrect lookup table for one month and causes New Melones to release increased fishery flows in May. This appendix provides findings from an analysis of potential effects of this model error.

## 5C. 1 Methodology

CalSim II model simulation representing the Second Basis of Comparison is rerun with the corrected New Melones Operations. The results are analyzed in two different sections. First, the Revised Second Basis of Comparison (SBC_R) is compared against the Second Basis of Comparison (SBC) to identify the extent of the effects of this model error. As presented in the next section, the results show that the effects of this model error is contained within the Stanislaus River. Secondly, the No Action Alternative (model results same as Alternative 2), Alternative 3, and Alternative 5 are compared against the Revised Second Basis of Comparison (SBC_R) and the Alternative 1 (same as Revised Second Basis of Comparison (SBC_R) is compared against the No Action Alternative. Results analysis in this appendix identifies between similar results (less than 5\%) and results with noticeable changes (greater than 5\%).

## 5C. 2 Analysis

## 5C.2.1 Revised Second Basis of Comparison Compared to the Second Basis of Comparison

Model results comparing Revised Second Basis of Comparison (SBC_R) to the Second Basis of Comparison (SBC) presented in Section 5C.3.1 of this document show that the effect of the CalSim II model error is confined to Stanislaus River basin and do not cause any significant change in the overall system operations.

## 5C.2.2 Revised Second Basis of Comparison Compared to the Alternatives

This section provides analysis of effects of the identified CalSim II model error on the Stanislaus River Basin. The section is organized by alternative comparison and by each parameter that is likely to change.
The changes described in this section are due to increased storage in New Melones and decrease and change in patter of flows in Stanislaus River downstream of New Melones under the Revised Second Basis of Comparison (Revised Alternative 1) compared to the Second Basis of Comparison (Alternative 1).

## 5C.2.2.1 Revised Alternative 1 Compared to the No Action Alternative

## 5C.2.2.1.1 New Melones Storage

Alternative 1 showed increased storage in October and November of above normal years (up to 6\%), October and April of below normal years (slightly above $5 \%$ ), October of dry years (slightly above 5\%), and October through June of critically dry years (up to 7\%) when compared to the No Action Alternative. Revised Alternative 1 shows increased storage in all months of all water year types when compared to the No Action Alternative (from approximately 6 to 44\%).

## 5C.2.2.1.2 New Melones Elevation

Alternative 1 showed similar elevation (within 5\% change) in all months of all water year types when compared to the No Action Alternative. Revised Alternative 1 shows increased reservoir elevation in all months of all water year types (from approximately 8 to 13\%) when compared to the No Action Alternative.

## 5C.2.2.1.3 Stanislaus River Flow below Goodwin

Flow patterns are different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in patterns.

- In wet years, Alternative 1 showed lower flows (from approximately 5 to 54\%) in October, March, May, July, and August, higher flows (from approximately 6 to $103 \%$ ) in November, December, January, June, and September), and similar flows (within 5\% change) in February and April when compared to the No Action Alternative.

Revised Alternative 1 shows lower flows (from approximately 8 to $57 \%$ ) in October, March, and May, higher flows (from approximately 12 to $59 \%$ ) in November, December, February, June, July, August, and September, and similar flows (within 5\% change) in January and April when compared to the No Action Alternative.

- In above normal years, Alternative 1 showed lower flows (from approximately 19 to 58\%) in October, March, and April months, higher flows (from approximately 7 to $54 \%$ ) in November, December, January, February, May, and June), and similar flows (within 5\% change) in July through September when compared to the No Action Alternative.

Revised Alternative 1 shows lower flows (from approximately 7 to $65 \%$ ) in October, March, April, and May, higher flows (from approximately 5 to 25\%) in November, December, and February, and similar flows (within 5\% change) in January and June through September when compared to the No Action Alternative.

- In below normal years, Alternative 1 showed lower flows (from approximately 14 to $61 \%$ ) in October, March, and April months, higher flows
(from approximately 5 to 66\%) in November through February, May, June, and September), and similar flows (within 5\% change) in July and August when compared to the No Action Alternative.

Revised Alternative 1 shows lower flows (from approximately 13 to 66\%) in October, March, April, May, and June, higher flows (from approximately 19 to 54\%) in November through February, and similar flows (within 5\% change) in July through September when compared to the No Action Alternative.

- In dry years, Alternative 1 showed lower flows (approximately 61 and 44\%) in October and April months, higher flows (from approximately 7 to 56\%) in November through March, May, and June), and similar flows (within 5\% change) in July through September when compared to the No Action Alternative.

Revised Alternative 1 shows lower flows (from approximately 7 to $65 \%$ ) in October, March, April, May, and June, higher flows (from approximately 8 to $36 \%$ ) in November through February, and similar flows (within 5\% change) in July through September when compared to the No Action Alternative.

- In critically dry years, Alternative 1 showed lower flows (approximately 66 and $37 \%$ ) in October and April months, higher flows (from approximately 5 to 41\%) in November through March, May, and July), and similar flows (within 5\% change) in June, August, and September when compared to the No Action Alternative.

Revised Alternative 1 shows lower flows (from approximately 10 to 74\%) in October, January, March, April, and May, higher flows (from approximately 6 to 18\%) in November, December, July, and August, and similar flows (within 5\% change) in February, June, and September when compared to the No Action Alternative.

## 5C.2.2.1.4 Stanislaus River Flow at Mouth

- In wet years, Alternative 1 showed higher flows (from approximately 5 to $81 \%$ ) in November, December, January, and June, lower flows (from approximately 7 to 44\%) in October, March, May, and August, and similar flows (within 5\% change) in February, April, July, and September when compared to the No Action Alternative.

Revised Alternative 1 shows lower flows (from approximately 7 to $47 \%$ ) in October, March, and May, higher flows (from approximately 11 to $46 \%$ ) in November, December, February, June, July, August, and September, and similar flows (within 5\% change) in January and April when compared to the No Action Alternative.

- In above normal years, Alternative 1 showed higher flows (from approximately 6 to 33\%) in November through February, May, and June, lower flows (from approximately 15 to 46\%) in October, March, and April,
and similar flows (within 5\% change) in July through September when compared to the No Action Alternative.
Revised Alternative 1 shows lower flows (from approximately 7 to $51 \%$ ) in October, March, April, and May, higher flows (from approximately 14 to $15 \%$ ) in November and December, and similar flows (within $5 \%$ change) in January, February, and June through September when compared to the No Action Alternative.
- In below normal years, Alternative 1 showed higher flows (from approximately 5 to $42 \%$ ) in November through February and June, lower flows (from approximately 9 to 49\%) in October, March, and April, and similar flows (within 5\% change) in May, July, August, and September when compared to the No Action Alternative.

Revised Alternative 1 shows lower flows (from approximately 9 to $52 \%$ ) in October and March through June, higher flows (from approximately 13 to 36\%) in November through February, and similar flows (within 5\% change) in July through September when compared to the No Action Alternative.

- In dry years, Alternative 1 showed higher flows (approximately 14 and 38\%) in November through March and May, lower flows (approximately 47\% and $42 \%$ ) in October and April, and similar flows (within 5\% change) in June through September when compared to the No Action Alternative.

Revised Alternative 1 shows lower flows (from approximately 5 to $50 \%$ ) in October, April, May, and June, higher flows (from approximately 5 to 25\%) in November through February, and similar flows (within 5\% change) in March and July through September when compared to the No Action Alternative.

- In critically dry years, Alternative 1 showed higher flows (approximately 8 and $30 \%$ ) in November through March and May, lower flows (approximately $54 \%$ and $37 \%$ ) in October and April, and similar flows (within $5 \%$ change) in June through September when compared to the No Action Alternative.

Revised Alternative 1 shows lower flows (from approximately 7 to $60 \%$ ) in October, January, March, April, and May, higher flows (from approximately 7 to $14 \%$ ) in November, December, and July, and similar flows (within 5\% change) in February, June, August, and September when compared to the No Action Alternative.

## 5C.2.2.1.5 Stanislaus River Water Temperature below Goodwin Dam

Alternative 1 showed similar temperatures at Goodwin except for higher temperatures in November of critically dry years (average increase of $0.7^{\circ} \mathrm{F}$ ) and lower temperatures in June and September of critically dry years (up to $1.3^{\circ} \mathrm{F}$ ) when compared to the No Action Alternative. Difference in temperature threshold exceedances were all within $5 \%$ (varied from $2 \%$ less to $3 \%$ more exceedances in January through May).

Revised Alternative 1 shows similar temperatures at Goodwin except for lower temperatures (from approximately 0.5 to $1.1^{\circ} \mathrm{F}$ ) in October and September of above normal years, August and September of dry years, and October, June, July, and September of critically dry years. Difference in temperature threshold exceedances are mostly within $5 \%$ ( $3 \%$ to 4\% more in January through April) and $5 \%$ more in May.

In general, Revised Alternative 1 shows higher temperatures for Steelhead smolts in Stanislaus when compared to the No Action Alternative.

5C.2.2.1.6 Stanislaus River Water Temperature at Orange Blossom Bridge
Alternative 1 showed similar temperatures at Orange Blossom Bridge except for higher temperatures in October of wet years, October and April of above normal, below normal, dry, and critically dry years (from approximately 0.6 to $1.9^{\circ} \mathrm{F}$ ) and lower temperatures in June of wet years, March and June of below normal years, and May and July of critically dry years (approximately from 0.6 to $0.7^{\circ} \mathrm{F}$ ) when compared to the No Action Alternative. Difference in temperature threshold exceedances showed $28 \%$ more exceedance in October (adult migration threshold), $6 \%$ more exceedance in April (smoltification threshold), $17 \%$ more exceedance in April (spawning threshold), 8\% less exceedance in May (smoltification threshold), and 5\% less in November (adult migration threshold) and March and May (spawning threshold).

Revised Alternative 1 shows similar temperatures at Orange Blossom Bridge except for higher temperatures (from approximately 0.5 to $2.1^{\circ} \mathrm{F}$ ) in October and March of wet years, October and April of above normal years, October and June of below normal years, October, April, and May of dry years, and October, March, and April of critically dry years; and lower temperatures (from approximately 0.5 to $1.2^{\circ} \mathrm{F}$ ) in September of wet years, August and September of dry years, and July, August, and September of critically dry years when compared to the No Action Alternative. Difference in temperature threshold exceedances showed $29 \%$ more exceedance in October (adult migration threshold), $10 \%$ more exceedance in March (smoltification threshold), $5 \%$ more exceedance in April (smoltification threshold), $14 \%$ more exceedance in March and April (spawning threshold), $9 \%$ more exceedance in May (spawning threshold), and $6 \%$ less in November (adult migration threshold), $8 \%$ less in August (rearing threshold).

In general, Revised Alternative 1 shows higher temperatures for Steelhead lifestages in Stanislaus when compared to the No Action Alternative.

## 5C.2.2.1.7 CVP Stanislaus Deliveries

Under Alternative 1, annual CVP service contract deliveries were increased by 4.5 TAF and annual water rights deliveries were increased by 2.3 TAF when compared to the No Action Alternative.

Under Revised Alternative 1, annual CVP service contract deliveries are increased by 14.8 TAF and annual water rights deliveries are increased by 6.2 TAF when compared to the No Action Alternative.

In general, Revised Alternative 1 shows increased CVP Stanislaus deliveries when compared to the No Action Alternative.

## 5C.2.2.1.8 CVP Power Generation

Long-term average power capacity and energy generation under Alternative 1 were $3 \%$ and $1 \%$ higher than the No Action Alternative. The energy use at the CVP pumping facilities was $16 \%$ higher than the No Action Alternative; which resulted in a $4 \%$ lower net generation.

In dry and critical years, long-term average power capacity and energy generation under Alternative 1 were $6 \%$ and $3 \%$ higher than the No Action Alternative. The energy use at the CVP pumping facilities was $11 \%$ higher than the No Action Alternative; which resulted in similar net generation.

Under the revised Alternative 1, long-term average power capacity and energy generation are $4 \%$ and $1 \%$ higher than the No Action Alternative. The energy use at the CVP pumping facilities is $15 \%$ higher than the No Action Alternative; which results in a $3 \%$ lower net generation.

In dry and critical years, long-term average power capacity and energy generation under Revised Alternative 1 are $10 \%$ and $5 \%$ higher than the No Action
Alternative. The energy use at the CVP pumping facilities is $15 \%$ higher than the No Action Alternative; which results 3\% higher net generation.

## 5C.2.2.1.9 New Melones Large Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 1 showed lower percentage of nest survival in June (approximately 13\%), higher percentage of nest survival ( $48 \%$ and $11 \%$ ) in October and April when compared to the No Action Alternative.

The Revised Alternative 1 shows lower percentage of nest survival (from approximately 7 to $14 \%$ ) in July through September, higher percentage of nest survival (approximately 49 and 10\%) in October and April when compared to the No Action Alternative.

- In above normal years, Alternative 1 showed lower percentage of nest survival in June (approximately 5\%), higher percentage of nest survival ( $29 \%$ and $9 \%$ ) in October and April when compared to the No Action Alternative.

The Revised Alternative 1 shows higher percentage of nest survival (from approximately 6 to 31\%) in October, April, July, and August when compared to the No Action Alternative.

- In below normal years, Alternative 1 showed lower percentage of nest survival (approximately 9\%) in June; and higher percentage of nest survival (from approximately $5 \%$ and $55 \%$ ) in October, March, April, and July when compared to the No Action Alternative.

The Revised Alternative 1 shows higher percentage of nest survival (from approximately 5 to $59 \%$ ) in October and March through August when compared to the No Action Alternative.

- In dry years, Alternative 1 showed lower percentage of nest survival (approximately 9\%) in May; and higher percentage of nest survival (from approximately $12 \%$ and $44 \%$ ) in October, April, and July when compared to the No Action Alternative.

The Revised Alternative 1 shows higher percentage of nest survival (from approximately 7 to $51 \%$ ) in October and April through September when compared to the No Action Alternative.

- In critically dry years, Alternative 1 showed lower percentage of nest survival (from approximately 12 to $23 \%$ ) in May, July, and August; and higher percentage of nest survival (from approximately $7 \%$ and $53 \%$ ) in October, April, and September when compared to the No Action Alternative.

The Revised Alternative 1 shows lower percentage of nest survival (from approximately 7 to $45 \%$ ) in June through August; and higher percentage of nest survival (from approximately 34 to $53 \%$ ) in October, April, and May when compared to the No Action Alternative.
In general, Revised Alternative 1 shows higher percentage of nest survival for the New Melones Large Mouth Bass when compared to the No Action Alternative.

## 5C.2.2.1.10 New Melones Small Mouth Bass Nest Survival Percentage

 Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.- In wet years, Alternative 1 showed lower percentage of nest survival in June (approximately $15 \%$ ), higher percentage of nest survival ( $59 \%$ and $9 \%$ ) in October and April when compared to the No Action Alternative.

The Revised Alternative 1 shows lower percentage of nest survival (from approximately 6 to $14 \%$ ) in July through September, higher percentage of nest survival (approximately 61 and $9 \%$ ) in October and April when compared to the No Action Alternative.

- In above normal years, Alternative 1 showed higher percentage of nest survival ( $41 \%$ and $10 \%$ ) in October and April when compared to the No Action Alternative.
The Revised Alternative 1 shows higher percentage of nest survival (from approximately 8 to $44 \%$ ) in October, April, July, and August when compared to the No Action Alternative.
- In below normal years, Alternative 1 showed lower percentage of nest survival (approximately 10 and 14\%) in June and July; and higher percentage of nest survival (from approximately $6 \%$ to $57 \%$ ) in October, March, and April when compared to the No Action Alternative.

The Revised Alternative 1 shows higher percentage of nest survival (from approximately 5 to $61 \%$ ) in October and March through August when compared to the No Action Alternative.

- In dry years, Alternative 1 showed lower percentage of nest survival (approximately $8 \%$ and $5 \%$ ) in May and November; and higher percentage of nest survival (from approximately $11 \%$ to $52 \%$ ) in October, April, and July when compared to the No Action Alternative.

The Revised Alternative 1 shows higher percentage of nest survival (from approximately 6 to 59\%) in October and April through September when compared to the No Action Alternative.

- In critically dry years, Alternative 1 showed lower percentage of nest survival (from approximately 5 to $22 \%$ ) in November, May, July, and August; and higher percentage of nest survival (from approximately $6 \%$ to $58 \%$ ) in October, April, and September when compared to the No Action Alternative.
The Revised Alternative 1 shows lower percentage of nest survival (from approximately 7 to $50 \%$ ) in June through September; and higher percentage of nest survival (from approximately 44 to $69 \%$ ) in October, and April when compared to the No Action Alternative.

In general, Revised Alternative 1 shows higher percentage of nest survival for the
New Melones Small Mouth Bass when compared to the No Action
Alternative except for the summer months of critically dry years.

## 5C.2.2.1.11 New Melones Spotted Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of
Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 1 showed higher percentage of nest survival (from approximately $6 \%$ to $13 \%$ ) in October, April, July and August when compared to the No Action Alternative.

The Revised Alternative 1 shows higher percentage of nest survival (from approximately $11 \%$ to $13 \%$ ) in October, April, and July when compared to the No Action Alternative.

- In above normal years, Alternative 1 showed similar percentage of nest survival when compared to the No Action Alternative.

The Revised Alternative 1 shows higher percentage of nest survival (from approximately $6 \%$ to $8 \%$ ) in July and August when compared to the No Action Alternative.

- In below normal years, Alternative 1 showed higher percentage of nest survival (from approximately $5 \%$ to $11 \%$ ) in October, April, and July when compared to the No Action Alternative.

The Revised Alternative 1 shows higher percentage of nest survival (from approximately 6 to 10\%) in October, April, and August when compared to the No Action Alternative.

- In dry years, Alternative 1 showed lower percentage of nest survival (approximately 5\%) in May when compared to the No Action Alternative.
The Revised Alternative 1 shows higher percentage of nest survival (from approximately $5 \%$ to $13 \%$ ) in May, July and August when compared to the No Action Alternative.
- In critically dry years, Alternative 1 showed lower percentage of nest survival (from approximately $10 \%$ to $17 \%$ ) in May and July; and higher percentage of nest survival (approximately 20\% to 9\%) in April and June when compared to the No Action Alternative.

The Revised Alternative 1 shows lower percentage of nest survival (approximately 7\%) in July; and higher percentage of nest survival (from approximately 5\% to 21\%) in April through June, and September when compared to the No Action Alternative.

In general, Revised Alternative 1 shows higher percentage of nest survival for the New Melones Spotted Bass when compared to the No Action Alternative.

## 5C.2.2.2 No Action Alternative Compared to the Revised Second Basis of Comparison

## 5C.2.2.2.1 New Melones Storage

No Action Alternative showed decreased storage in October and November of above normal years (up to 6\%), October and April of below normal years (slightly above $5 \%$ ), October of dry years (slightly above 5\%), and October through June of critically dry years (up to 7\%) when compared to the Second Basis of Comparison. When compared to the Revised Second Basis of Comparison, the No Action Alternative shows decreased storage (from approximately 6 to 44\%) in all months of all water year types.

## 5C.2.2.2.2 New Melones Elevation

No Action Alternative showed similar reservoir elevation (within 5\% change) in all months of all water year types when compared to the Second Basis of Comparison. When compared to the Revised Second Basis of Comparison, the No Action Alternative shows decreased reservoir elevation in all months of all water year types (from approximately 8 to 13\%).

## 5C.2.2.2.3 Stanislaus River Flow below Goodwin

Flow patterns are different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in patterns.

- In wet years, the No Action Alternative showed lower flows (from approximately 5 to $51 \%$ ) in November, December, January, June, and

September months, higher flows (from approximately 10 to 117\%) in October, March, May, July, and August, and similar flows (within 5\% change) in February and April when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower flows (from approximately 11 to 37\%) in November, December, February, June, July, August, and September, higher flows (from approximately 9 to $134 \%$ ) in October, March, and May, and similar flows (within 5\% change) in January and April when compared to the No Action Alternative.

- In above normal years, the No Action Alternative showed lower flows (from approximately 6 to 35\%) in November, December, January, February, May, and June months, higher flows (from approximately 23 to 137\%) in October, March, and April, and similar flows (within 5\% change) in July through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower flows (from approximately 5 to 20\%) in November, December, and February, higher flows (from approximately 8 to 188\%) in October, March, April, and May, and similar flows (within 5\% change) in January and June through September when compared to the No Action Alternative.

- In below normal years, the No Action Alternative showed lower flows (from approximately 5 to $40 \%$ ) in November through February, May, June, and September) months, higher flows (from approximately 16 to $157 \%$ ) in October, March, and April, and similar flows (within 5\% change) in July and August when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower flows (from approximately 16 to 35\%) in November through February, higher flows (from approximately 15 to 192\%) in October, March, April, May, and June, and similar flows (within 5\% change) in July through September.

- In dry years, the No Action Alternative showed lower flows (approximately 6 to 36\%) in November through March, May, and June, higher flows (from approximately 154 and $77 \%$ ) in October and April months, and similar flows (within 5\% change) in July through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower flows (from approximately 8 to 26\%) in November through February, higher flows (from approximately 8 to 189\%) in October, March, April, May, and June, and similar flows (within 5\% change) in July through September.

- In critically dry years, the No Action Alternative showed lower flows (approximately 9 to $29 \%$ ) in November through March, and May, higher flows (approximately 197 and 60\%) in October and April months, and similar
flows (within 5\% change) in June through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower flows (from approximately 6 to $15 \%$ ) in November, December, July, and August, higher flows (from approximately 12 to 277\%) in October, January, March, April, and May, and similar flows (within 5\% change) in February, June, and September.

## 5C.2.2.2.4 Stanislaus River Flow at Mouth

Flow patterns are different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in patterns.

- In wet years, No Action Alternative showed lower flows (from approximately 5 to 45\%) in November, December, January, and June, higher flows (from approximately 8 to 79\%) in October, March, May, and August, and similar flows (within 5\% change) in February, April, July, and September when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, No Action Alternative shows lower flows (from approximately 10 to 32\%) in November, December, February, and June through September, higher flows (from approximately 8 to $88 \%$ ) in October, March, and May, and similar flows (within 5\% change) in January and April when compared to No Action Alternative.
- In above normal years, No Action Alternative showed lower flows (from approximately 6 to $25 \%$ ) in November through February and May and June, higher flows (from approximately 18 to 84\%) in October, March, and April, and similar flows (within 5\% change) in July, August, and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, No Action Alternative shows lower flows (approximately 13 and 12\%) in November and December, higher flows (from approximately 7 to 106\%) in October, March, April, and May, and similar flows (within 5\% change) in January, February, and June through September when compared to the No Action Alternative.

- In below normal years, No Action Alternative showed lower flows (from approximately 12 to 29\%) in November through February and June, higher flows (from approximately 10 to $94 \%$ ) in October, March, and April, and similar flows (within 5\% change) in May, and July through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, No Action Alternative shows lower flows (from approximately 11 to 26\%) in November through February, higher flows (from approximately 10 to 109\%) in October and March through June, and similar flows (within 5\% change) in July through September.

- In dry years, No Action Alternative showed lower flows (approximately 5 to 28\%) in, November through March and May and June, higher flows (approximately $88 \%$ and $73 \%$ ) in October and April, and similar flows (within $5 \%$ change) in June through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, No Action Alternative shows lower flows (approximately 5 to 20\%) in November through February, higher flows (from approximately 6 to 102\%) in October, April, May, and June, and similar flows (within 5\% change) in March and July through September.

- In critically dry years, No Action Alternative showed lower flows (approximately 7 to $23 \%$ ) in November through March, and May, higher flows (approximately 118 and 58\%) in October and April and similar flows (within 5\% change) in June through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, No Action Alternative shows lower flows (from approximately 6 to 12\%) in November, December, and July, higher flows (from approximately 27 to 149\%) in October, January, March, April, May, and July, and similar flows (within 5\% change) in February, June, August, and September.

## 5C.2.2.2.5 Stanislaus River Water Temperature below Goodwin Dam

No Action Alternative showed similar temperatures at Goodwin except for higher temperatures in June and September critically dry years (average increase of 0.8 and $1.3^{\circ} \mathrm{F}$ ) and lower temperatures in November of critically dry years (up to $0.7^{\circ} \mathrm{F}$ ) when compared to the Second Basis of Comparison. Difference in temperature threshold exceedances were all within $5 \%$ (varied from $3 \%$ less to 2\% more exceedances in January through May).

No Action Alternative shows similar temperatures at Goodwin except for higher temperatures (from approximately 0.5 to $1.1^{\circ} \mathrm{F}$ ) in October and September of above normal years, August and September of dry years, and October, June, July, and September of critically dry years when compared to the Revised Second Basis of Comparison. Difference in temperature threshold exceedances are mostly within $5 \%$ ( $2 \%$ to 4\% less in January through April) and 5\% less in May.
In general, No Action Alternative shows lower temperatures for Steelhead smolts in Stanislaus when compared to the Revised Second Basis of Comparison.

## 5C.2.2.2.6 Stanislaus River Water Temperature at Orange Blossom Bridge

No Action Alternative showed similar temperatures at Orange Blossom Bridge except for lower temperatures in October of wet years, October and April of above normal, below normal, dry, and critically dry years (from approximately 0.6 to $1.9^{\circ} \mathrm{F}$ ) and higher temperatures in June of wet years, March and June of below normal years, and May and July of critically dry years (approximately from 0.6 to $0.7^{\circ} \mathrm{F}$ ) when compared to the Second Basis of Comparison. Difference in
temperature threshold exceedances showed 28\% less exceedance in October (adult migration threshold), $6 \%$ less exceedance in April (smoltification threshold), $17 \%$ less exceedance in April (spawning threshold), $8 \%$ more exceedance in May (smoltification threshold), and 5\% more in November (adult migration threshold) and March and May (spawning threshold).

No Action Alternative shows similar temperatures at Orange Blossom Bridge except for lower temperatures (from approximately 0.5 to $2.1^{\circ} \mathrm{F}$ ) in October and March of wet years, October and April of above normal years, October and June of below normal years, October, April, and May of dry years, and October, March, and April of critically dry years; and higher temperatures (from approximately 0.5 to $1.2^{\circ} \mathrm{F}$ ) in September of wet years, August and September of dry years, and July, August, and September of critically dry years when compared to the Revised Second Basis of Comparison. Difference in temperature threshold exceedances showed $29 \%$ less exceedance in October (adult migration threshold), $10 \%$ less exceedance in March (smoltification threshold), $5 \%$ less exceedance in April (smoltification threshold), $14 \%$ less exceedance in March and April (spawning threshold), $9 \%$ less exceedance in May (spawning threshold), and 6\% more in November (adult migration threshold), $8 \%$ more in August (rearing threshold).

In general, No Action Alternative shows lower temperatures for Steelhead lifestages in Stanislaus when compared to the Revised Second Basis of Comparison.

## 5C.2.2.2.7 CVP Stanislaus Deliveries

Under the No Action Alternative, annual CVP service contract deliveries were decreased by 4.5 TAF and annual water rights deliveries were decreased by 2.3 TAF when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, annual CVP service contract deliveries are decreased by 14.8 TAF and annual water rights deliveries are decreased by 6.2 TAF under the No Action Alternative.

In general, the No Action Alternative shows decreased CVP Stanislaus deliveries when compared to the Revised Second Basis of Comparison.

## 5C.2.2.2.8 CVP Power Generation

Long-term average power capacity and energy generation under the No Action Alternative were $3 \%$ and $1 \%$ lower than the Second Basis of Comparison. The energy use at the CVP pumping facilities was $14 \%$ lower than the Second Basis of Comparison; which resulted in a $4 \%$ higher net generation.

In dry and critical years, long-term average power capacity and energy generation under the No Action Alternative were $6 \%$ and $3 \%$ lower than the Second Basis of Comparison. The energy use at the CVP pumping facilities was $10 \%$ lower than the Second Basis of Comparison; which resulted in similar net generation.

When compares to the Revised Second Basis of Comparison, long-term average power capacity and energy generation are $4 \%$ and $1 \%$ lower under the No Action

Alternative. The energy use at the CVP pumping facilities is $13 \%$ lower than the Revised Second Basis of Comparison; which results in a 3\% higher net generation.

In dry and critical years, long-term average power capacity and energy generation under the No Action Alternative are $9 \%$ and 4\% lower than the Revised Second Basis of Comparison. The energy use at the CVP pumping facilities is $9 \%$ lower than the Revised Second Basis of Comparison; which results 3\% lower net generation.

## 5C.2.2.2.9 New Melones Large Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, the No Action Alternative showed higher percentage of nest survival in June (approximately 16\%); and lower percentage of nest survival ( $32 \%$ and $10 \%$ ) in October and April when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows higher percentage of nest survival (from approximately 8 to 16\%) in July through September; and lower percentage of nest survival (approximately 33 and 9\%) in October and April.

- In above normal years, the No Action Alternative showed higher percentage of nest survival in June (approximately 5\%); and lower percentage of nest survival ( $22 \%$ and $8 \%$ ) in October and April when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 6 to 23\%) in October, April, July, and August.

- In below normal years, the No Action Alternative showed higher percentage of nest survival (approximately 10\%) in June; and lower percentage of nest survival (from approximately $5 \%$ and $35 \%$ ) in October, March, April, and July when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 5 to 37\%) in October and March through August.

- In dry years, the No Action Alternative showed higher percentage of nest survival (approximately $10 \%$ ) in May; and lower percentage of nest survival (from approximately $11 \%$ and 31\%) in October, April, May, July and August when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 7 to $34 \%$ ) in October and April through September.

- In critically dry years, the No Action Alternative showed higher percentage of nest survival (from approximately 13 to 30\%) in May, July, and August; and lower percentage of nest survival (from approximately $6 \%$ and $35 \%$ ) in October, April, and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows higher percentage of nest survival (from approximately 7 to $81 \%$ ) in June through August; and lower percentage of nest survival (from approximately 25 to 35\%) in October, April, and May.

In general, the No Action Alternative shows lower percentage of nest survival for the New Melones Large Mouth Bass when compared to the Revised Second Basis of Comparison.

## 5C.2.2.2.10 New Melones Small Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, the No Action Alternative showed higher percentage of nest survival in June (approximately 17\%); and lower percentage of nest survival ( $37 \%$ and $9 \%$ ) in October and April when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, the No Action Alternative shows higher percentage of nest survival (from approximately 8 to $16 \%$ ) in July through September; and lower percentage of nest survival (approximately 38 and 8\%) in October and April.
- In above normal years, the No Action Alternative showed lower percentage of nest survival ( $29 \%$ and $9 \%$ ) in October and April when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 7 to 30\%) in October, April, July, and August.

- In below normal years, the No Action Alternative showed higher percentage of nest survival (approximately 11\%) in June; and lower percentage of nest survival (from approximately $6 \%$ to $37 \%$ ) in October, March, April, and July when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 6 to $38 \%$ ) in October, March through May, July, and August.
- In dry years, the No Action Alternative showed higher percentage of nest survival (approximately $5 \%$ and $8 \%$ ) in November and May; and lower percentage of nest survival (from approximately $10 \%$ to $34 \%$ ) in October, April, and July when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 6 to $37 \%$ ) in October and April through.

- In critically dry years, the No Action Alternative showed higher percentage of nest survival (from approximately 5 to 28\%) in November, May, July, and August; and lower percentage of nest survival (from approximately $6 \%$ to $37 \%$ ) in October, April, and September when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, the No Action Alternative shows higher percentage of nest survival (from approximately 8 to $100 \%$ ) in June through September; and lower percentage of nest survival (from approximately 23 to 41\%) in October, April, and May.
In general, the No Action Alternative shows lower percentage of nest survival for the New Melones Small Mouth Bass when compared to the Revised Second Basis of Comparison except for the summer months of critically dry years.

## 5C.2.2.2.11 New Melones Spotted Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, the No Action Alternative showed lower percentage of nest survival (from approximately $5 \%$ to $12 \%$ ) in October, April, July, and August when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately $10 \%$ to $12 \%$ ) in October, April, and July.

- In above normal years, the No Action Alternative showed similar percentage of nest survival when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 5 to 7\%) in July and August.

- In below normal years, the No Action Alternative showed lower percentage of nest survival (from approximately 5\% to 10\%) in October, April, and July when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 5 to $9 \%$ ) in October, April, and August.

- In dry years, the No Action Alternative showed higher percentage of nest survival (approximately 5\%) in May when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 8\% to $12 \%$ ) in July and August.

- In critically dry years, the No Action Alternative showed higher percentage of nest survival (from approximately $11 \%$ to $21 \%$ ) in May and July; and lower percentage of nest survival (from approximately $8 \%$ to $17 \%$ ) in April and June when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows higher percentage of nest survival (from approximately $5 \%$ to $8 \%$ ) in July and August; and lower percentage of nest survival (from approximately $5 \%$ to $18 \%$ ) in April through June, and September.
In general, the No Action Alternative shows lower percentage of nest survival for the New Melones Spotted Bass when compared to the Revised Second Basis of Comparison.

## 5C.2.2.3 Alternative 3 Compared to the Revised Second Basis of Comparison

## 5C.2.2.3.1 New Melones Storage

Alternative 3 showed increased storage (from approximately 8 to $32 \%$ ) almost all months of all water year types except for February through May of wet years (less than $5 \%$ increase). When compared to the Revised Second Basis of Comparison, Alternative 3 shows similar storage in all months of all water year types (changes within 5\%).

## 5C.2.2.3.2 New Melones Elevation

Alternative 3 showed similar reservoir elevation in all months of all water year types (changes within 5\%). When compared to the Revised Second Basis of Comparison, Alternative 3 still shows similar reservoir elevation in all months of all water year types (changes within $5 \%$ ).

## 5C.2.2.3.3 Stanislaus River Flow below Goodwin

Flow patterns are different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in patterns.

- In wet years, Alternative 3 showed lower flows (from approximately 40 to 45\%) in May and June, higher flows (from approximately 9 to 67\%) in December, February, March, July, August, and September, and similar flows (within 5\% change) in October, November, January, and April when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 17 to 30\%) in May and June, higher flows (from approximately 5 to 19\%) in October, December, February, and

July, and similar flows (within 5\% change) in November, January, March, April, August, and September when compared to Alternative 3.

- In above normal years, Alternative 3 showed lower flows (from approximately 14 to 79\%) in November, May, June, and July months, higher flows (from approximately 5 to 23\%) in October, March, and April, and similar flows (within 5\% change) in December, January, February, August, and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 10 to $74 \%$ ) in May through July, higher flows (from approximately 6 to 30\%) in October through January, March, and April, and similar flows (within 5\% change) in February, August, and September when compared to Alternative 3.

- In below normal years, Alternative 3 showed lower flows (from approximately 7 to 58\%) in October, November, December, March, May, June, and September, higher flows (from approximately 18 to $32 \%$ ) in January, February, and April, and similar flows (within 5\% change) in August and September when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 7 to 38\%) in November, December, March, May, and June, higher flows (from approximately 6 to 44\%) in October and January, and similar flows (within 5\% change) in February, April, July, August, and September.
- In dry years, Alternative 3 showed lower flows (approximately 5 to $36 \%$ ) in, November through March, May, and June, higher flows (approximately 40\%) in April, and similar flows (within 5\% change) in October and July through September when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (approximately 26\%) in June, higher flows (from approximately 8 to 19\%) in October, March, and April, and similar flows (within 5\% change) in November through February, May, and July through September.
- In critically dry years, Alternative 3 showed lower flows (approximately 8 to 31\%) in November through March and May through July, higher flows (approximately 5 to 47\%) in October, April, and September, and similar flows (within 5\% change) in August when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 6 to 19\%) in January, February, June, and July, higher flows (from approximately 9 to 36\%) in October, November, December, March, April, and May, and similar flows (within 5\% change) in August and September.

## 5C.2.2.3.4 Stanislaus River Flow at Mouth

- In wet years, Alternative 3 showed lower flows (from approximately 12 to 39\%) in May and June, higher flows (from approximately 8 to 58\%) in December, February, March, July, August, and September, and similar flows (within 5\% change) in October, November, January, and April when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 15 to 25\%) in May and June, higher flows (from approximately 6 to 17\%) in October, December, February, and July, and similar flows (within 5\% change) in November, January, March, April, August, and September when compared to Alternative 3.

- In above normal years, Alternative 3 showed lower flows (from approximately 10 to 63\%) in November, May, June, and July, higher flows (approximately 19\%) in April, and similar flows (within 5\% change) in October, December, January, February, March, August, and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 9 to 57\%) in May through July, higher flows (from approximately 8 to 17\%) in October, December, March, and April, and similar flows (within $5 \%$ change) in November, February, August, and September when compared to Alternative 3.

- In below normal years, Alternative 3 showed lower flows (from approximately 9 to 44\%) in November, December, March, May, June, and September, higher flows (from approximately 16 to 23\%) in January, February, and April, and similar flows (within 5\% change) in July, August, and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 7 to 26\%) in November, December, May, and June, higher flows (approximately 30\%) in January, and similar flows (within 5\% change) in October, February, March, April, July, August, and September.

- In dry years, Alternative 3 showed lower flows (approximately 9 to $26 \%$ ) in, November December, January, March, May, and June, higher flows (approximately 38\%) in April, and similar flows (within 5\% change) in October, February, and July through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (approximately 18\%) in June, higher flows (from approximately 9 to $18 \%$ ) in October and April, and similar flows (within 5\% change) in November through March, May, and July through September.

- In critically dry years, Alternative 3 showed lower flows (approximately 6 to 28\%) in November through March and May through July, higher flows
(approximately 45\%) in April, and similar flows (within 5\% change) in October, August, and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 10 to 15\%) in February, June, and July, higher flows (from approximately 6 to 32\%) in October, November, December, March, April, and May, and similar flows (within 5\% change) in January, August, and September.

## 5C.2.2.3.5 Stanislaus River Water Temperature below Goodwin Dam

Alternative 3 showed similar temperatures at Goodwin except for lower temperatures in October of above normal years, October and November of below normal years, September of dry years, and October, November, May, and July through September of critically dry years (varied from 0.5 to $1.5^{\circ} \mathrm{F}$ )when compared to the Second Basis of Comparison. Difference in temperature threshold exceedances were all within $5 \%$ (varied from $3 \%$ less to $3 \%$ more exceedances in March through May).

Alternative 3 shows similar temperatures at Goodwin except for higher temperatures in June (approximately $0.6^{\circ} \mathrm{F}$ ) and lower temperatures in September (approximately $0.6^{\circ} \mathrm{F}$ ) of critically dry years when compared to the Revised Second Basis of Comparison. Difference in temperature threshold exceedances are mostly within 5\% ( $1 \%$ to $4 \%$ less in January, February, and April) and 5\% less in May.

In general, Alternative 3 shows lower temperatures for Steelhead smolts in Stanislaus when compared to the Revised Second Basis of Comparison.

## 5C.2.2.3.6 Stanislaus River Water Temperature at Orange Blossom Bridge

Alternative 3 showed similar temperatures at Orange Blossom Bridge except for higher temperatures in June of wet years, May through July of above normal, March and June of below normal years, March, May, and June of dry years, and February and June of critically dry years (from approximately 0.5 to $4.3^{\circ} \mathrm{F}$ ) and lower temperatures in August wet years, April of below normal and dry years, and October, November, April, August, and September of critically dry years (approximately from 0.5 to $1.2^{\circ} \mathrm{F}$ ) when compared to the Second Basis of Comparison. Difference in temperature threshold exceedances showed $16 \%$ less exceedance in April (spawning threshold), $7 \%$ more exceedance in May (smoltification threshold), and 8\% more in March (spawning threshold) and 10\% more in May (spawning threshold).

Alternative 3 showed similar temperatures at Orange Blossom Bridge except for higher temperatures in June of wet years, June and July of above normal, June of below normal and dry years, and June and July of critically dry years (from approximately 0.6 to $5.1^{\circ} \mathrm{F}$ ) and lower temperatures in October of wet and above normal years, October and April of dry years, and October, March, April, and September of critically dry years (approximately from 0.5 to $1.2^{\circ} \mathrm{F}$ ) when compared to the Revised Second Basis of Comparison. Difference in temperature
threshold exceedances showed 10\% less exceedance in March (smoltification threshold), $5 \%$ less exceedance in May (smoltification threshold), 11 and $12 \%$ less in March and April (spawning threshold), and 5\% more exceedance in July (rearing threshold).
In general, Alternative 3 shows lower temperatures for Steelhead lifestages in Stanislaus when compared to the Revised Second Basis of Comparison.

## 5C.2.2.3.7 CVP Stanislaus Deliveries

Under Alternative 3, annual CVP service contract deliveries were increased by 15.1 TAF and annual water rights deliveries were increased by 2.6 TAF when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, annual CVP service contract deliveries are increased by 4.8 TAF ; however annual water rights deliveries are decreased by 1.2 TAF under Alternative 3.
In general, the Alternative 3 shows increased Stanislaus deliveries to CVP service contractors and similar (slightly decreased) deliveries to water right holders when compared to the Revised Second Basis of Comparison.

## 5C.2.2.3.8 CVP Power Generation

Under Alternative 3, long-term average power capacity was $1 \%$ higher and energy generation was similar when compared to the Second Basis of Comparison. The energy use at the CVP pumping facilities was $4 \%$ lower than the Second Basis of Comparison; which resulted in a $1 \%$ higher net generation.

In dry and critical years, long-term average power capacity and energy generation under Alternative 3 were both $1 \%$ lower than the Second Basis of Comparison. The energy use at the CVP pumping facilities was $8 \%$ lower than the Second Basis of Comparison; which resulted in $4 \%$ higher net generation.
When compared to the Revised Second Basis of Comparison, long-term average power capacity and energy generation are both $1 \%$ lower under Alternative 3. The energy use at the CVP pumping facilities is $4 \%$ lower than the Revised Second Basis of Comparison; which results in similar net generation.
In dry and critical years, long-term average power capacity and energy generation under Alternative 3 are 3\% and 1\% lower than the Revised Second Basis of Comparison. The energy use at the CVP pumping facilities is $7 \%$ lower than the Revised Second Basis of Comparison; which results 1\% higher net generation.

## 5C.2.2.3.9 New Melones Large Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 3 showed higher percentage of nest survival in July through September (from approximately $5 \%$ and $45 \%$ ); and lower percentage
of nest survival ( $7 \%$ and 6\%) in May and June when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 3 shows higher percentage of nest survival (from approximately 12 to 62\%) in July through September; and lower percentage of nest survival (approximately 7 and 20\%) in May and June.
- In above normal years, Alternative 3 showed higher percentage of nest survival in June through August (from approximately $10 \%$ to 38 when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower percentage of nest survival in June (approximately $6 \%$ ) in August; and higher percentage of nest survival (approximately $24 \%$ and 17\%) in June and July.
- In below normal years, Alternative 3 showed higher percentage of nest survival (approximately 15\%) in May and June; and lower percentage of nest survival (from approximately $9 \%$ and $21 \%$ ) in December, April, and July when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower percentage of nest survival (from approximately 7 to $18 \%$ ) in December, April, July, and August.
- In dry years, Alternative 3 showed higher percentage of nest survival (from approximately $5 \%$ to $21 \%$ ) in February, June, and August; and lower percentage of nest survival (approximately $20 \%$ and $17 \%$ ) in April and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower percentage of nest survival (from approximately 7 to $23 \%$ ) in October, April, May, July, and September.

- In critically dry years, Alternative 3 showed higher percentage of nest survival (approximately $7 \%$ to $56 \%$ ) in February and May; and lower percentage of nest survival (from approximately 5\% and 37\%) in, April, and June through September when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 3 shows higher percentage of nest survival (approximately 25\%) in August; and lower percentage of nest survival (from approximately 10 to 28\%) in April, May, July, and September.
In general, the Alternative 3 shows lower percentage of nest survival for the New Melones Large Mouth Bass when compared to the Revised Second Basis of Comparison except for summer months of wet years.

## 5C.2.2.3.10 New Melones Small Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 3 showed higher percentage of nest survival in July and August (approximately $53 \%$ and $24 \%$ ); and lower percentage of nest survival (approximately 7\%) in May when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 3 shows higher percentage of nest survival (from approximately 12 to 72\%) in July through September; and lower percentage of nest survival (approximately 8 and $18 \%$ ) in May and June.

- In above normal years, Alternative 3 showed higher percentage of nest survival in June through August (from approximately 8\% to 35\%) when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower percentage of nest survival (approximately 7\%) in August; and higher percentage of nest survival (approximately $28 \%$ and $16 \%$ ) in June and July.
- In below normal years, the Alternative 3 showed higher percentage of nest survival (from approximately 7\% to 16\%) in November, May, and June; and lower percentage of nest survival (from approximately $9 \%$ to $23 \%$ ) in December, April, and July when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, the Alternative 3 shows lower percentage of nest survival (from approximately 8 to 18\%) in December, April, July, and August.
- In dry years, the Alternative 3 showed higher percentage of nest survival (from approximately $5 \%$ to $19 \%$ ) in February, June, and August; and lower percentage of nest survival (approximately $20 \%$ and $16 \%$ ) in April, and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the Alternative 3 shows lower percentage of nest survival (from approximately 7 to $22 \%$ ) in October, April, May, July, and September.

- In critically dry years, the Alternative 3 showed higher percentage of nest survival (from approximately 8 to 51\%) in February and May; and lower percentage of nest survival (from approximately $8 \%$ to $40 \%$ ) in April, and June through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the Alternative 3 shows higher percentage of nest survival (from approximately 5 to $31 \%$ ) in February and August; and lower percentage of nest survival
(from approximately 8\% to 27\%) in October, April, May, July, and September.

In general, the Alternative 3 shows lower percentage of nest survival for the New Melones Small Mouth Bass when compared to the Revised Second Basis of Comparison.

## 5C.2.2.3.11 New Melones Spotted Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 3 showed lower percentage of nest survival (from approximately $8 \%$ to $22 \%$ ) in May and June when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 3 shows higher percentage of nest survival (from approximately $5 \%$ to $8 \%$ ) in August and September; and lower percentage of nest survival (approximately $8 \%$ and $23 \%$ ) in May and June.

- In above normal years, Alternative 3 showed lower percentage of nest survival (from approximately $8 \%$ to $35 \%$ ) in August and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower percentage of nest survival (from approximately $8 \%$ to $18 \%$ ) in August and September.

- In below normal years, the Alternative 3 showed higher percentage of nest survival (from approximately $5 \%$ to $6 \%$ ) in May and June; and lower percentage of nest survival (from approximately $9 \%$ to $18 \%$ ) in December, April, July, and August when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, the Alternative 3 shows lower percentage of nest survival (from approximately $9 \%$ to 18\%) in December, April, July, and August.
- In dry years, the Alternative 3 showed lower percentage of nest survival (from approximately $6 \%$ to $21 \%$ ) in April, May, July and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the Alternative 3 shows lower percentage of nest survival (from approximately 7 to $24 \%$ ) in April, May, and July through September.

- In critically dry years, the Alternative 3 showed higher percentage of nest survival (from approximately $5 \%$ to $26 \%$ ) in May and June; and lower percentage of nest survival (from approximately $7 \%$ to $10 \%$ ) in March, April, and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the Alternative 3 shows lower percentage of nest survival (from approximately $6 \%$ to $10 \%$ ) in March through May, July, and September.
In general, the Alternative 3 shows lower percentage of nest survival for the New Melones Spotted Bass when compared to the Revised Second Basis of Comparison.

## 5C.2.2.4 Alternative 5 Compared to the Revised Second Basis of Comparison

## 5C.2.2.4.1 New Melones Storage

Alternative 5 showed decreased storage (from approximately 6 to 23\%) almost all months of all water year types except for June through September of wet years (less than 5\% decrease). When compared to the Revised Second Basis of Comparison, Alternative 5 shows further decreased storage (from approximately 8 to $43 \%$ ) in all months of all water year types.

## 5C.2.2.4.2 New Melones Elevation

Alternative 5 showed similar reservoir elevation (changes within 5\%) in all months of all water year types. When compared to the Revised Second Basis of Comparison, Alternative 5 shows decreased storage in all months of all water year types (from approximately 9 to $13 \%$ ).

## 5C.2.2.4.3 Stanislaus River Flow below Goodwin

Flow patterns are different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in patterns.

- In wet years, Alternative 5 showed lower flows (from approximately 6 to $53 \%$ ) in November, December, January, and June through September, higher flows (from approximately 16 to 113\%) in October, March, and May, and similar flows (within 5\% change) in February and April when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 14 to $40 \%$ ) in November, December, February, and June through September, higher flows (from approximately 11 to 129\%) in October, March, and May, and similar flows (within 5\% change) in January and April when compared to Alternative 5.
- In above normal years, Alternative 5 showed lower flows (from approximately 7 to $37 \%$ ) in November through February and June, higher flows (from approximately 23 to 134\%) in October, March, April, and May, and similar flows (within 5\% change) in July, August, and September when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 7 to $22 \%$ ) in November, December,
and February, higher flows (from approximately 11 to 185\%) in October, March, April, and May, and similar flows (within 5\% change) in January and June through September when compared to Alternative 5.
- In below normal years, Alternative 5 showed lower flows (from approximately 5 to 40\%) in November through February, June, and September, higher flows (from approximately 16 to 155\%) in October, March, and April, and similar flows (within 5\% change) in May, July, and August when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 16 to 35\%) in November through February, higher flows (from approximately 11 to 189\%) in October and March through June, and similar flows (within 5\% change) in July through September.

- In dry years, Alternative 5 showed lower flows (approximately 8 to $36 \%$ ) in, November through March and June, higher flows (approximately 25 to 148\%) in October, April, and May, and similar flows (within 5\% change) in July through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (approximately 8 to 26\%) in November through February, higher flows (from approximately 8 to $182 \%$ ) in October and March through June, and similar flows (within 5\% change) in July through September.

- In critically dry years, Alternative 5 showed lower flows (approximately 8 to 30\%) in November through March, Jun, and July, higher flows
(approximately 7 to 193\%) in October, April, and May, and similar flows (within 5\% change) in August and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 5 to 17\%) in November, December, February, June, July, and August, higher flows (from approximately 8 to $272 \%$ ) in October, January, March, April, and May, and similar flows (within $5 \%$ change) in September.

## 5C.2.2.4.4 Stanislaus River Flow at Mouth

Flow patterns are different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in patterns.

- In wet years, Alternative 5 showed lower flows (from approximately 5 to 47\%) in November, December, January, and June through September, higher flows (from approximately 14 to 77\%) in October, March, and May, and similar flows (within 5\% change) in February and April when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 12 to 34\%) in November, December,

February, and June through September, higher flows (from approximately 10 to $86 \%$ ) in October, March, and May, and similar flows (within 5\% change) in January and April when compared to Alternative 5.

- In above normal years, Alternative 5 showed lower flows (from approximately 6 to $26 \%$ ) in November through February and June, higher flows (from approximately 18 to 82\%) in October, March, April, and May, and similar flows (within 5\% change) in July, August, and September when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 6 to 15\%) in November, December, and February, higher flows (from approximately 8 to 104\%) in October, March, April, and May, and similar flows (within 5\% change) in January and June through September when compared to Alternative 5.
- In below normal years, Alternative 5 showed lower flows (from approximately 12 to 34\%) in November through February and June, higher flows (from approximately 10 to 93\%) in October, March, and April, and similar flows (within 5\% change) in May, July, August, and September when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 11 to 27\%) in November through February, higher flows (from approximately 8 to 108\%) in October and March through June, and similar flows (within 5\% change) in July through September.
- In dry years, Alternative 5 showed lower flows (approximately 6 to $28 \%$ ) in, November through March and June, higher flows (approximately 23 to 142\%) in October, April, and May, and similar flows (within 5\% change) in July through September when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (approximately 6 to 20\%) in November through February, higher flows (from approximately 77 to 107\%) in October, April, and May, and similar flows (within 5\% change) in March and June through September.
- In critically dry years, Alternative 5 showed lower flows (approximately 7 to 24\%) in November through March, Jun, and July, higher flows
(approximately 7 to $149 \%$ ) in October, April, and May, and similar flows (within 5\% change) in August and September when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 6 to 13\%) in November, December, June, July, and August, higher flows (from approximately 6 to 147\%) in October, January, March, April, and May, and similar flows (within 5\% change) in February and September.

## 5C.2.2.4.5 Stanislaus River Water Temperature below Goodwin Dam

Alternative 5 showed similar temperatures at Goodwin except for higher temperatures in October of wet years, October, July, August, and September of below normal years, October, November, July, August, and September of dry years, October, April, May, August, and September of critically dry years (varied from 0.5 to $1.9^{\circ} \mathrm{F}$ ), and lower temperatures in December and February of critically dry years (approximately $0.5^{\circ} \mathrm{F}$ ) when compared to the Second Basis of Comparison. Difference in temperature threshold exceedances were within 5\% (varied from $1 \%$ less to $2 \%$ more exceedances in February, March, and May) and higher (approximately 6\%) in April.

Alternative 5 shows similar temperatures at Goodwin except for higher temperatures in October of wet years, October, November, August and September of above normal years, October, August, and September of below normal years, October through December and July through September of dry years, October, November, May, and July through September of critically dry years (varied from 0.5 to $2.5^{\circ} \mathrm{F}$ ) when compared to the Revised Second Basis of Comparison. Difference in temperature threshold exceedances are within $5 \%$ (varied from 4\% less to $3 \%$ more exceedances in January through April).

In general, Alternative 5 shows lower temperatures for Steelhead smolts in Stanislaus when compared to the Revised Second Basis of Comparison.

## 5C.2.2.4.6 Stanislaus River Water Temperature at Orange Blossom Bridge

Alternative 5 showed similar temperatures at Orange Blossom Bridge except for lower temperatures in October of wet years, October and April of above normal, below normal, dry, and critically dry years (from approximately 0.7 to $1.6^{\circ} \mathrm{F}$ ) and higher temperatures in November and June of wet years, June and September of below normal years, August and September of dry years, and June through September of critically dry years (approximately from 0.5 to $1.3^{\circ} \mathrm{F}$ ) when compared to the Second Basis of Comparison. Difference in temperature threshold exceedances showed $27 \%$ less exceedance in October (adult migration threshold), $8 \%$ less exceedance in April (smoltification threshold), $26 \%$ less exceedance in April (spawning threshold), $8 \%$ more exceedance in November (adult migration threshold), $6 \%$ more exceedance in April (smoltification threshold), and $6 \%$ more exceedance in July (rearing threshold), and $8 \%$ more in August and September (rearing threshold).
Alternative 5 shows similar temperatures at Orange Blossom Bridge except for lower temperatures (from approximately 0.5 to $1.7^{\circ} \mathrm{F}$ ) in October and March of wet years, October, March, and May of above normal years, October of below normal years, October, April, and May of dry years, and October, March, April, and May of critically dry years; and higher temperatures (from approximately 0.6 to $1.7^{\circ} \mathrm{F}$ ) in July through September of wet years, November and September of above normal years, September of below normal years, November, and July through September of dry years, and November and June through September of critically dry years when compared to the Revised Second Basis of Comparison. Difference in temperature threshold exceedances showed $28 \%$ less exceedance in

October (adult migration threshold), $10 \%$ less exceedance in March (smoltification threshold), $7 \%$ less exceedance in April (smoltification threshold), $15 \%$ less exceedance in May (smoltification threshold), 15,23 , and $17 \%$ less exceedance in March, April, and May respectively (spawning threshold), and 9\% more in November (adult migration threshold) , and 7, 13, and 11\% more in July, August, and September respectively (rearing threshold).

In general, Alternative 5 shows lower temperatures for Steelhead lifestages in Stanislaus except for higher temperatures when Steelhead is rearing in summer; when compared to the Revised Second Basis of Comparison.

## 5C.2.2.4.7 CVP Stanislaus Deliveries

Under Alternative 5, annual CVP service contract deliveries were decreased by 8.4 TAF and annual water rights deliveries were decreased by 8.1 TAF when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, annual CVP service contract deliveries are decreased by 18.6 TAF and annual water rights deliveries are decreased by 11.9 TAF under Alternative 5.
In general, the Alternative 5 shows decreased CVP Stanislaus deliveries when compared to the Revised Second Basis of Comparison.

## 5C.2.2.4.8 CVP Power Generation

Under Alternative 5, long-term average power capacity and energy generation were $4 \%$ and $1 \%$ lower when compared to the Second Basis of Comparison. The energy use at the CVP pumping facilities was $14 \%$ lower than the Second Basis of Comparison; which resulted in a $4 \%$ higher net generation.

In dry and critical years, long-term average power capacity and energy generation under Alternative 5 were both $1 \%$ lower than the Second Basis of Comparison. The energy use at the CVP pumping facilities was $8 \%$ lower than the Second Basis of Comparison; which resulted in $4 \%$ higher net generation.

When compared to the Revised Second Basis of Comparison, long-term average power capacity and energy generation are $5 \%$ and $1 \%$ lower under Alternative 5. The energy use at the CVP pumping facilities is $14 \%$ lower than the Revised Second Basis of Comparison; which results in 3\% higher net generation.

In dry and critical years, long-term average power capacity and energy generation under Alternative 5 are 12\% and $5 \%$ lower than the Revised Second Basis of Comparison. The energy use at the CVP pumping facilities is $9 \%$ lower than the Revised Second Basis of Comparison; which results 3\% lower net generation.

## 5C.2.2.4.9 New Melones Large Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 5 showed higher percentage of nest survival in June (approximately 19\%); and lower percentage of nest survival (from approximately $5 \%$ through $28 \%$ ) in October, April, May, and July through August when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower percentage of nest survival (from approximately $5 \%$ to $28 \%$ ) in October, May, and August.
- In above normal years, the Alternative 5 showed lower percentage of nest survival (from 6\% to 23\%) in October and April through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the Alternative 5 shows lower percentage of nest survival (from approximately 6 to 29\%) in October and April through September.

- In below normal years, the Alternative 5 showed higher percentage of nest survival (approximately 6\%) in June; and lower percentage of nest survival (from approximately $5 \%$ and $38 \%$ ) in October, March, April, May, and July through September when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, the Alternative 5 shows lower percentage of nest survival (from approximately 5 to $40 \%$ ) in October and March through September.
- In dry years, the Alternative 5 showed higher percentage of nest survival (approximately 5\%) in February; and lower percentage of nest survival (from approximately $11 \%$ and $47 \%$ ) in October, April, May, and July through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower percentage of nest survival (from approximately 9 to $45 \%$ ) in October and April through September.

- In critically dry years, Alternative 5 showed higher percentage of nest survival (from approximately 5 to 82\%) in February, and June through September and lower percentage of nest survival (approximately $21 \%$ and $69 \%$ ) in October, and April when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, Alternative 5 shows higher percentage of nest survival (from approximately 17 to $148 \%$ ) in June through September; and lower percentage of nest survival (from approximately 26 to $67 \%$ ) in October, April, and May.

In general, the Alternative 5 shows lower percentage of nest survival for the New Melones Large Mouth Bass when compared to the Revised Second Basis of Comparison except for summer months of the critically dry years.

## 5C.2.2.4.10 New Melones Small Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 5 showed higher percentage of nest survival in June (approximately 19\%); and lower percentage of nest survival (from approximately $7 \%$ through 34\%) in October, May, and July through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower percentage of nest survival (from approximately $5 \%$ to $35 \%$ ) in October, May, and August.

- In above normal years, the Alternative 5 showed lower percentage of nest survival (from 7\% to 28\%) in October and April through September when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, the Alternative 5 shows lower percentage of nest survival (from approximately 7 to 29\%) in October and April through September.
- In below normal years, the Alternative 5 showed higher percentage of nest survival (approximately 8\%) in June; and lower percentage of nest survival (from approximately $6 \%$ and $39 \%$ ) in October, March, April, May, and July through September when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, the Alternative 5 shows lower percentage of nest survival (from approximately 6 to 41\%) in October and March through September.
- In dry years, the Alternative 5 showed higher percentage of nest survival (approximately $5 \%$ ) in November and February; and lower percentage of nest survival (from approximately $11 \%$ and $45 \%$ ) in October, April, May, and July through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower percentage of nest survival (from approximately 9 to 48\%) in October, and April through September.

- In critically dry years, Alternative 5 showed higher percentage of nest survival (from approximately 5 to $92 \%$ ) in November, February, and May through September and lower percentage of nest survival (approximately $26 \%$ and $67 \%$ ) in October and April when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 5 shows higher percentage of nest survival (from approximately 28 to $179 \%$ ) in June through September; and lower percentage of nest survival (from approximately 31 to 65\%) in October, April and May.

In general, the Alternative 5 shows lower percentage of nest survival for the New Melones Small Mouth Bass when compared to the Revised Second Basis of Comparison except for summer months of the critically dry years.

## 5C.2.2.4.11 New Melones Spotted Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 5 showed lower percentage of nest survival (approximately 8\%) in August when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower percentage of nest survival (approximately 6\%) in August.

- In above normal years, the Alternative 5 showed lower percentage of nest survival (from $8 \%$ to $21 \%$ ) in April, June, July and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the Alternative 5 shows lower percentage of nest survival (from approximately $8 \%$ to 24\%) in April, and June through September.

- In below normal years, the Alternative 5 showed lower percentage of nest survival (from approximately $13 \%$ and $22 \%$ ) in October, April, May, and July through September when compared to the Second Basis of Comparison.
When compared to the Revised Second Basis of Comparison, the Alternative 5 shows lower percentage of nest survival (from approximately $6 \%$ to 22\%) in October, and April through September.
- In dry years, the Alternative 5 showed lower percentage of nest survival (from approximately $6 \%$ and $22 \%$ ) in October, and April through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower percentage of nest survival (from approximately $6 \%$ to $28 \%$ ) in October, and April through September.

- In critically dry years, Alternative 5 showed higher percentage of nest survival (from approximately $13 \%$ to $18 \%$ ) in July and August; and lower percentage of nest survival (approximately 31\% and 57\%) in April and May when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 5 shows higher percentage of nest survival (from approximately $5 \%$ to $13 \%$ ) in July and August; and lower percentage of nest survival (from approximately $7 \%$ to $56 \%$ ) in April, May, and September.

In general, the Alternative 5 shows lower percentage of nest survival for the New Melones Spotted Bass when compared to the Revised Second Basis of Comparison except for summer months of the critically dry years.

## 5C. 3 Results

## 5C.3.1 Revised Second Basis of Comparison vs. Second Basis of Comparison Results

5C.3.1.1 Trinity Storage
5C.3.1.2 Shasta Storage
5C.3.1.3 Oroville Storage
5C.3.1.4 Folsom Storage
5C.3.1.5 New Melones Storage
5C.3.1.6 Trinity Elevation
5C.3.1.7 Shasta Elevation
5C.3.1.8 Oroville Elevation
5C.3.1.9 Folsom Elevation
5C.3.1.10 New Melones Elevation
5C.3.1.11 Delta Outflow
5C.3.1.12 Exports through Jones and Banks Pumping Plants
5C.3.1.13 Trinity River below Lewiston Dam
5C.3.1.14 Clear Creek below Whiskeytown Dam
5C.3.1.15 Sacramento River downstream of Keswick Reservoir
5C.3.1.16 Feather River downstream of Thermalito Afterbay
5C.3.1.17 Fremont Weir Spills
5C.3.1.18 American River below Nimbus Dam
5C.3.1.19 Sacramento River at Freeport
5C.3.1.20 Yolo Bypass Flow
5C.3.1.21 San Joaquin River at Vernalis Flow
5C.3.1.22 San Joaquin River at Vernalis Salinity
5C.3.1.23 Stanislaus River below Goodwin Flow
5C.3.1.24 Stanislaus River at Mouth Flow

## 5C.3.2 Revised Second Basis of Comparison vs. Second Basis of Comparison Results

5C.3.2.1 New Melones Storage
5C.3.2.2 New Melones Elevation
5C.3.2.3 Stanislaus River below Goodwin Flow
5C.3.2.4 Stanislaus River at Mouth Flow
5C.3.2.5 Stanislaus River below New Melones Reservoir Temperature
5C.3.2.6 Stanislaus River below Tulloch Reservoir Temperature
5C.3.2.7 Stanislaus River below Goodwin Dam Temperature
5C.3.2.8 Stanislaus River at Orange Blossom Bridge Temperature
5C.3.2.9 Stanislaus River at Mouth Temperature
5C.3.2.10 San Joaquin River at Vernalis Flow
5C.3.2.11 Delta Outflow
5C.3.2.12 X2 Position
5C.3.2.13 Old and Middle River Flow
5C.3.2.14 Exports through Jones and Banks Pumping Plant
5C.3.2.15 CVP Deliveries
5C.3.2.16 CVP Total Capacity
5C.3.2.17 CVP Total Generation
5C.3.2.18 CVP Total Energy Use
5C.3.2.19 CVP Net Generation
5C.3.2.20 Salmon Mortality
5C.3.2.21 New Melones Large Mouth Bass Nest Survival Percentage
5C.3.2.22 New Melones Small Mouth Bass Nest Survival Percentage
5C.3.2.23 New Melones Spotted Bass Nest Survival Percentage
5C.3.2.24 Temperature Threshold Exceedances
5C.3.2.25 CVP Annual Power Generation Summary
5C.3.3 Second Basis of Comparison vs. No Action Alternative, Alternative 3, and Alternative 5 Results
5C.3.3.1 New Melones Storage
5C.3.3.2 New Melones Elevation
5C.3.3.3 Stanislaus River below Goodwin Flow
5C.3.3.4 Stanislaus River at Mouth Flow

5C.3.3.5 Stanislaus River below New Melones Reservoir Temperature
5C.3.3.6 Stanislaus River below Tulloch Reservoir Temperature
5C.3.3.7 Stanislaus River below Goodwin Dam Temperature
5C.3.3.8 Stanislaus River at Orange Blossom Bridge Temperature
5C.3.3.9 Stanislaus River at Mouth Temperature
5C.3.3.10 San Joaquin River at Vernalis Flow
5C.3.3.11 Delta Outflow
5C.3.3.12 X2 Position
5C.3.3.13 Old and Middle River Flow
5C.3.3.14 Exports through Jones and Banks Pumping Plant
5C.3.3.15 CVP Deliveries
5C.3.3.16 CVP Total Capacity
5C.3.3.17 CVP Total Generation
5C.3.3.18 CVP Total Energy Use
5C.3.3.19 CVP Net Generation
5C.3.3.20 Salmon Mortality
5C.3.3.21 New Melones Large Mouth Bass Nest Survival Percentage
5C.3.3.22 New Melones Small Mouth Bass Nest Survival Percentage
5C.3.3.23 New Melones Spotted Bass Nest Survival Percentage
5C.3.3.24 Temperature Threshold Exceedances
5C.3.3.25 CVP Annual Power Generation Summary

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Altermative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Second Basis of Comparison and Altermative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Altermative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same
therefore Second Basis of Comparison and Altermative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Second Basis of Comparison and Altermative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Second Basis of Comparison and Altermative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Altermative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same
therefore Second Basis of Comparison and Altermative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Altermative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030,
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altematives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altematives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82-year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altematives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and № Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 81-year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 81 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 81 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 81 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 81 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 81 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altematives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 81 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 81 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 81 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altematives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82-year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

[^2]b Based on the 82-year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and $N o$ Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altematives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and № Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

|  |  |  | Dry | 4,392 | 4,459 | -67 |
|  |  |  | Critical | 3,437 | 3,460 | -22 |

Notes: 1) Long-term Average is the average quantity for the 82-year simulation period. 2) Dry and Critical Year designations are defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030. 3) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 4) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences are discussed in the text. 5) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences are discussed in the text. 6) Annual deliveries are based on March to February Average.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the
Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and № Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and $N o$ Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030,
Notes: 1) All altematives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82-year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

 Classification (SWRCB D-1641, 1999); projected to Year 2030. 3) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 4) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences are discussed in text. 5) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82-year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82-year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030,
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82-year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030,
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and № Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82-year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altematives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on an 81-year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on an 81-year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on an 81 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Altermative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on an 81 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altematives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on an 81-year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altematives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on an 81 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on an 81 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and № Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altematives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and № Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) X 2 is defined as the position of the $2 \%$ (grams of salt per kilogram of seawater) bottom salinity value along the axis of the estuary; measured in kilometers from the Golden Gate Bridge. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and And Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82-year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) X 2 is defined as the position of the $2 \%$ (grams of salt per kilogram of seawater) bottom salinity value along the axis of the estuary; measured in kilometers from the Golden Gate Bridge. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82-year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) X 2 is defined as the position of the $2 \%$ (grams of salt per kilogram of seawater) bottom salinity value along the axis of the estuary; measured in kilometers from the Golden Gate Bridge. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Altermative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and $N o$ Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Notes: 1) Long-term Average is the average quantity for the 82-year simulation period. 2) Dry and Critical Year designations are defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D1641, 1999); projected to Year 2030.3) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 4) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 5) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text. 6) Contra Costa Water District accounted for as part of North of Delta deliveries.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82-year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and № Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4, and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

| Critical (15\%) | -1\% | 9\% | 24\% | 51\% | 113\% | 21\% | 0\% | 0\% | 0\% | 2\% | 4\% | 3\% |

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82-year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

## Appendix 5D

## Municipal and Industrial Water Demands and Supplies

## 5D. 1 Introduction

Most water supply agencies in California that serve more than 3,000 connections or more than 3,000 acre-feet of water prepare Urban Water Management Plans (UWMPs) for submittal to the California Department of Water Resources. The UWMPs include water demand and water supply projections through at least 2030. The future water demands include assumptions for implementation of water conservation measures to meet the statewide mandate to reduce municipal and industrial (M\&I) water demand by 20 percent by 2020.
Information from the UWMPs for Central Valley Project (CVP) and State Water Project (SWP) water users was used as input information in the CWEST model (see Appendix 19A, CWEST Model) to project M\&I water supply economic changes. For small water users that did not prepare a UWMP, information was obtained from water master plans and integrated regional water management plans. This information is summarized in the following sections of this appendix. The tabular format is consistent for each water user and was established to be consistent with the input files for the CWEST model; therefore, there are rows in the tabular format that are not used for some M\&I water users.

## 5D. 2 Central Valley Region

This section includes summaries of water demand and water supply projections for M\&I users of CVP and SWP water supplies in the Central Valley Region, including water rights users on the Sacramento and American rivers. The M\&I water users are generally organized geographically in this section from north to south. See Tables 5D. 1 through 5D. 31 .

Appendix 5D: Municipal and Industrial Water Demands and Supplies

1 Table 5D. 1 Bella Vista Water District (BVWD)

| Items | Water Demand and Supplies (acre-feet) | Notes |
| :---: | :---: | :---: |
| Water Demand |  |  |
| Service Area Water Demand | 14,567 | BVWD serves portions of Redding. Assumed growth rate from City of Redding 2010 Urban Water Management Plan. |
| Water Sales to Others | - | - |
| Total Demand | 14,567 | - |
| Water Supplies for No Action Alternative (NAA) |  |  |
| CVP Water Supplies | 14,445 | CVP Water Service Contract 24,578 acre-feet, includes 24,000 acre-feet (14-06-200-851A-LTR1) and 578 acre-feet assigned from Shasta County Water Agency initial CVP Water Service Contract (14-06-200-3464A-LTR1). |
| SWP Water Supplies | - | - |
| Other Imported Water Supplies | - | - |
| Local Surface Water Supplies | - | - |
| Groundwater | 122 | Assumed no increase in wells. |
| Recycled Wastewater | - | - |
| Recycled Stormwater | - | - |
| Desalination | - | - |
| Transfers/Exchanges | - | - |
| Conservation | - | - |
| Total Water Supplies for NAA | 14,567 | - |
| Possible Future Water Supplies |  | - |
| Subtotal Possible Future Water Supplies | - | - |
| Total Potential Future Water Supplies | - | - |

1 Table 5D. 2 Centerville Community Services District

| Items | Water Demand and Supplies (acre-feet) | Notes |
| :---: | :---: | :---: |
| Water Demand |  |  |
| Service Area Water Demand | 3,185 | - |
| Water Sales to Others | - | - |
| Total Demand | 3,185 | - |
| Water Supplies for NAA |  |  |
| CVP Water Supplies | 3,185 | CVP Water Exchange Contract 900 acre-feet (pre-1914 water right on Clear Creek) and CVP Water Service Contract 2,900 acre-feet, (14-06-200-3367A-LTR1). |
| SWP Water Supplies | - | - |
| Other Imported Water Supplies | - | - |
| Local Surface Water Supplies | - | - |
| Groundwater | - | - |
| Recycled Wastewater | - | - |
| Recycled Stormwater | - | - |
| Desalination | - | - |
| Transfers/Exchanges | - | - |
| Conservation | - | - |
| Total Water Supplies for NAA | 3,185 | - |
| Possible Future Water Supplies | - | - |
| Subtotal Possible Future Water Supplies | - | - |
| Total Potential Future Water Supplies | - | - |
| Other Information | - | Sanitary Survey states that 25\% of 35-mgd Water Treatment Plant is owned by Centerville Community Services District (Redding Area Water Suppliers. 2011. Redding Area Watershed Sanitary Survey). |

Note:
$\mathrm{mgd}=$ million gallons per day

Appendix 5D: Municipal and Industrial Water Demands and Supplies

1 Table 5D. 3 City of Shasta Lake

| Items | Water Demand and Supplies (acre-feet) | Notes |
| :---: | :---: | :---: |
| Water Demand |  |  |
| Service Area Water Demand | 2,455 | City of Shasta Lake. 2014. 2010 Urban Water Management Plan, Administrative Draft. July. |
| Water Sales to Others | 470 | - |
| Total Demand | 2,925 | - |
| Water Supplies for NAA |  |  |
| CVP Water Supplies | 2,885 | CVP Water Exchange Contract 900 acre-feet (pre-1914 water right on Clear Creek) and CVP Water Service Contract 2,900 acre-feet, (14-06-200-3367A-LTR1). |
| SWP Water Supplies | - | - |
| Other Imported Water Supplies | - | - |
| Local Surface Water Supplies | - | - |
| Groundwater | - | - |
| Recycled Wastewater | 112 | - |
| Recycled Stormwater | - | - |
| Desalination | - | - |
| Transfers/Exchanges | - | - |
| Conservation | - | - |
| Total Water Supplies for NAA | 2,997 |  |
| Possible Future Water Supplies |  |  |
| Subtotal Possible Future Water Supplies | - | - |
| Other Information | - | Supplies do not include transfers not approved by Reclamation due to cold water pool issues: AndersonCottonwood Irrigation District 2,000 acre-feet, MCM Properties at 325 acre-feet. <br> Future project would develop facilities that would allow these transfers and result in 2,325 acre-feet normal year and 2,093 acre-feet in 3rd multiple dry years per 2010 UWMP (with reference to support from Reclamation). |
| Total Potential Future Water Supplies | 2,997 | - |

1 Table 5D. 4 Clear Creek Community Services District (CCCSD)

| Items | Water Demand and Supplies (acre-feet) | Notes |
| :---: | :---: | :---: |
| Water Demand |  |  |
| Service Area Water Demand | 7,410 | CCCSD serves areas near Redding. Assumed growth rate from City of Redding 2010 Urban Water Management Plan. |
| Water Sales to Others | - | - |
| Total Demand | 7,410 | - |
| Water Supplies for NAA |  |  |
| CVP Water Supplies | 7,410 | CVP Water Service Contract 15,300 acre-feet, (14-06-200-4894ALTR1). |
| SWP Water Supplies | - | - |
| Other Imported Water Supplies | - | - |
| Local Surface Water Supplies | - | - |
| Groundwater | - | - |
| Recycled Wastewater | - | - |
| Recycled Stormwater | - | - |
| Desalination | - | - |
| Transfers/Exchanges | - | - |
| Conservation | - | - |
| Total Water Supplies for NAA | 7,410 | - |
| Possible Future Water Supplies |  |  |
| Subtotal Possible Future Water Supplies | - | - |
| Total Potential Future Water Supplies | - | - |
| Other Information | - | Sanitary Survey states that 25\% of $35-\mathrm{mgd}$ Water Treatment Plant is owned by Centerville Community Services District (Redding Area Water Suppliers. 2011. Redding Area Watershed Sanitary Survey). |

Appendix 5D: Municipal and Industrial Water Demands and Supplies

| Subtotal Possible Future Water Supplies | - | - |
| Total Potential Future Water Supplies | 239,800 | - |

Appendix 5D: Municipal and Industrial Water Demands and Supplies

1 Table 5D. 33 East Bay Municipal Utility District

| Items | Water Demand and Supplies (acre-feet) | Notes |
| :---: | :---: | :---: |
| Water Demand |  |  |
| Service Area Water Demand | $\begin{array}{r} 349,440 \\ \text { (Projected } 2040 \\ \text { Water Demand) } \end{array}$ | East Bay Municipal Utility District. 2011. Urban Water Management Plan 2010 Document. June. |
| Water Sales to Others | - | - |
| Total Demand | 349,440 | - |
| Water Supplies for NAA |  |  |
| CVP Water Supplies | Dry year supply | Up to 133,000 acre-feet in a dry year, with a maximum of 165,000 acre-feet over three dry years, CVP Water Service Contract (14-08-200-5183ALTR1) from the American River. |
| SWP Water Supplies | - | - |
| Other Imported Water Supplies | Up to 240,800 | East Bay Municipal Utility District has up to 364,037 acre-feet of water rights on the Mokelumne River, but available amount varies depending on hydrology per 2011. Urban Water Management Plan 2010 Document. June. <br> "Other Imported Water Supplies" include East Bay Municipal Utility District's entitlements on the Mokelumne River. Although East Bay Municipal Utility District has water rights up to 364,037 acre-feet, the actual amount available in any given year varies depending on hydrology, required releases to senior downstream water rights holders, and releases to meet instream flow requirements. |
| Local Surface Water Supplies | 16,800 | Water rights from local watersheds within the East Bay Municipal Utility District (EBMUD) watershed average 16,800 to 28,000 acre-feet per East Bay Municipal Utility District. 2011. Urban Water Management Plan 2010 Document. |
| Groundwater | Dry year supply | Up to 1,120 acre-feet in dry years from Bayside Groundwater Project Phase 1 groundwater recharge facility within EBMUD service area per East Bay Municipal Utility District. 2011. Urban Water Management Plan 2010 Document. June. |

| Items | Water Demand and Supplies (acre-feet) | Notes |
| :---: | :---: | :---: |
| Recycled Wastewater | 22,400 | 22,400 acre-feet in East Bay Municipal Utility District. 2011. Urban Water Management Plan 2010 Document. June. <br> East Bay Municipal Utility District's goal is to deliver 22,400 acre-feet of recycled water by the year 2040. |
| Recycled Stormwater | - | - |
| Desalination |  |  |
| Transfers/Exchanges ${ }^{\text {a }}$ | Dry year supply | 5,040 to 49,952 acre-feet in dry years transfers from Northern California water users per East Bay Municipal Utility District. 2012. Water Supply Management Program 2040 Plan. April. |
| Conservation | 69,440 | East Bay Municipal Utility District's Water Conservation Master Plan is based on 69,440 acre-feet conservation in 2040 per East Bay Municipal Utility District. 2011. Urban Water Management Plan 2010 Document. June. East Bay Municipal Utility District's goal for conservation is 69,440 acre-feet by the year 2040. |
| Other Projects: Bayside Groundwater Project Phase $2^{\text {a }}$ | Dry year supply | 2,240 to 10,080 acre-feet in dry years Bayside Groundwater Project Phase 2 per East Bay Municipal Utility District. 2011. Urban Water Management Plan 2010 Document. June. |
| Total Water Supplies for NAA | 349,440 <br> Non-Dry year supply | Does not include CVP water supply for dry years, up to 15 percent rationing in dry years, or other dry year supply projects. <br> During normal years, East Bay Municipal Utility District anticipates having sufficient supplies to meet demands. Meeting customer demands during dry years will depend on the use of CVP supplies, rationing, and the implementation of additional water supply projects. |
| Possible Future Water Supplies |  |  |
| Other Projects: Groundwater Banking outside of East Bay Municipal Utility District Service Area ${ }^{\text {a }}$ | Dry year supply | Dry year supply of 4,704 acre-feet of groundwater banking in Sacramento Valley and/or 19,500 acre-feet in San Joaquin Valley; not anticipated until 2040 per East Bay Municipal Utility District. 2012. Water Supply Management Program 2040 Plan. April. |

Appendix 5D: Municipal and Industrial Water Demands and Supplies

| Items | Water Demand and Supplies (acre-feet) | Notes |
| :---: | :---: | :---: |
| Regional Desalination Facility ${ }^{\text {a }}$ | Dry year supply- | Up to 22,400 acre-feet from regional desalination facility; however, not anticipated until 2040 per East Bay Municipal Utility District. 2012. Water Supply Management Program 2040 Plan. April. |
| Other Projects: Enlarge Lower Bear Reservoir ${ }^{\text {a }}$ | Dry year supply- | Up to 4,500 acre-feet in dry years; however, not in plan for 2030 per East Bay Municipal Utility District. 2012. Water Supply Management Program 2040 Plan. April. |
| Other Projects: Expand Los Vaqueros Reservoira | Dry year supply- | Exact amount available to be determined and additional study needed per East Bay Municipal Utility District. 2011. Urban Water Management Plan 2010 Document. June. |
| Subtotal Possible Future Water Supplies | - | All future projects not included for M\&I No Action Alternative assumptions since some of the future projects are not fully defined or analyzed, or are scheduled to be completed after 2030. |
| Total Potential Future Water Supplies | $349,440$ <br> Non-Dry year supply | Does not include CVP water supply for dry years, up to 15 percent rationing in dry years, or other dry year supply projects. |

${ }^{\text {a }}$ East Bay Municipal Utility District has identified a range of water supply projects that it will pursue simultaneously to meet future water needs. By considering a broad mix of projects, with inherent scalability and the ability to adjust implementation schedules for a particular component, East Bay Municipal Utility District will be able to minimize the risks associated with future uncertainties such as project implementation challenges and climate change. If East Bay Municipal Utility District is able to successfully develop one component, this could result in deferral of other additional water supply components over the planning period.

1 Table 5D. 34 Zone 7 Water Agency

| Items | Water Demand and Supplies (acre-feet) | Notes |
| :---: | :---: | :---: |
| Water Demand |  |  |
| Service Area Water Demand | 66,300 | Assume Low Water Demand to serve a portion of Livermore, Pleasanton, Dublin-San Ramon Services District, and Cal-Water Water Company, plus local retail treated and untreated water. Does not include 9,200 acre-feet for groundwater recharge. <br> Zone 7 Water Agency. 2010. 2010 Urban Water Management Plan. December 15. |

## Appendix 5E

## Sensitivity Analysis - Revised Second Basis of Comparison with no Fremont Weir Notch

Comment Number 90 from State Water Contractors on the Draft LTO EIS discussed that the Reasonable and Prudent Alternative (RPA) actions from the 2008 USFWS BO and 2009 NMFS BO should not have been included in the Second Basis of Comparison, including a specific reference to restoration of tidal habitat under Component 4 of the RPA in the USFWS BO and restoration of floodplain habitat under Action I.6.1 of the RPA in the NMFS BO.

As described in Section 3.3.1.2 of Chapter 3, Description of Alternatives, in the Draft EIS, tidal wetlands restoration activities under Component 4 of the USFWS BO include actions adopted, initiated, or constructed since 2012 (e.g., Suisun Marsh Habitat Management, Preservation, and Restoration Plan and restoration activities in the Cache Slough area); and therefore, were considered to be included in all of the alternatives and the Second Basis of Comparison.

As described in Section 3.3.1.2, substantial efforts have been completed to develop floodplain restoration activities under Action I.6.1 of the NMFS BO; however, specific details of the floodplain restoration activities have not been completed at this time. Therefore, the EIS analysis used published assumptions related to water operations associated with Action I.6.1, including use of an operable gate to convey water from Sacramento River near Fremont Weir into Yolo Bypass.

Although inclusion of an operable gate at the Fremont Weir is considered reasonable and foreseeable and is included in the Second Basis of Comparison, a sensitivity analysis without the operable gate was conducted to analyze possible effects of the operable gate on overall system operations.

The inclusion of an operable gate at the Fremont Weir would primarily affect flows in the Yolo Bypass and have minimal, if any effects, on flows in the Sacramento River downstream of the Fremont Weir or in the Delta, as shown in this sensitivity analysis. The model results of this sensitivity analysis are presented in Section 5E. 3 of this appendix.

## 5E. 1 Methodology

CalSim II model simulation representing the Revised Second Basis of Comparison ${ }^{1}$ is rerun without an operable gate (notch) in the Fremont Weir. The Revised Second Basis of Comparison 2 (SBC_R_2) is compared against the

[^4]1 Revised Second Basis of Comparison (SBC_R) to identify the extent of the 2 effects of this change. As presented in the next section, the results show that the effects of the removal of the Fremont Weir notch are primarily contained within the Yolo Bypass and the Sacramento River downstream of the Fremont Weir.

10 Sacramento River flows at Freeport, all of the parameters are similar (less than 5

## 17 5E. 3 Model Run Results

## 5E. 2 Analysis Results

Model results comparing Revised Second Basis of Comparison without an operable gate (notch) in the Fremont Weir (SBC_R_2) to the Revised Second Basis of Comparison (SBC_R) presented in Section 5E.3.1. Except for flow over Fremont Weir from the Sacramento River, flow in the Yolo Bypass, and percent change) under both model runs.
In general, with the removal of the Fremont Weir notch, Fremont Weir spills to Yolo Bypass are reduced. As a results of this, Yolo Bypass flows are reduced, Sacramento River flows at Freeport are increased, and Sacramento River flows at Rio Vista are similar. Because this is a rerouting of high flows, no additional changes are observed in overall system.

Model results for the Revised Second Basis of Comparison compared with Second Basis of Comparison Results are presented on the following pages.
5E.3.1 Trinity Storage
5E.3.2 Shasta Storage
5E.3.3 Oroville Storage
5E.3.4 Folsom Storage
5E.3.5 New Melones Storage

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030 .
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Altermative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Altermative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
C As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
C As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same,
therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year
b Based on the 82 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030,
Notes: 1) All altematives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
b Based on the 82 -year simulation period.
c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

Notes:

1) Long-term Average is the average quantity for the 82 -year simulation period.
2) Dry and Critical Year designations are defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030
3) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.
4) Model results for Alternatives 1,4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences are discussed in the text.
5) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences are discussed in the text.
6) Annual deliveries are based on March to February Average.

Notes:

1) Long-term Average is the average quantity for the 82 -year simulation period.
2) Dry and Critical Year designations are defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
3) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.
4) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences are discussed in the text.
5) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences are discussed in the text.

Appendix 6A was not used in this document.

This page left blank intentionally.

[^0]:    a Exceedance probability is defined as the probability a given value will be exceeded in any one year.
    b Based on the 82-year simulation period.
    c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.
    Notes: 1) All altermatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1,4 , and Second Basis of Comparison are the same,
    therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Altemative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.
