

## **Newspaper advertisement**

The American Falls Dam concrete spillway rehabilitation project resumes on or around May 9, 2022. Construction activities are expected to continue no later than Oct. 15, 2022.

The concrete spillway project is a multi-year construction project that started in 2020 and will finish in 2022.

Residents and visitors may experience traffic restrictions and increased traffic supporting construction activities on SH-39 and within the City of American Falls traveling to and from the construction site. Reclamation is coordinating with the Idaho Transportation Department throughout the project.

The planned construction activities address the need for rehabilitation and repair of the 44-year-old dam, which has experienced degradation over the years. Construction activities consist of the demolition, removal, and replacement of existing damaged concrete on the spillway face and dam face.

Given its size and location relative to other Reclamation facilities located throughout the upper Snake River storage system, American Falls Reservoir is heavily relied upon for the delivery of water for irrigation purposes. American Falls Reservoir is typically full or near full, with water receding as the irrigation season progresses. Reclamation plans to operate American Falls Reservoir through the construction period, consistent with previous years. Water storage conditions in the reservoir and discharges from the dam can be found at the project web page identified below.

A water quality restoration plan to monitor and mitigate for water quality issues is included within the final environmental assessment. Reclamation is actively working with Idaho Department of Environmental Quality, Idaho Power Company, and Idaho Fish and Game throughout the planning and construction phases to monitor and mitigate water quality issues.
