MISSION STATEMENTS

U.S. Department of the Interior

Protecting America's Great Outdoors and Powering our Future.

The U.S. Department of the Interior protects America's natural resources and heritage, honors our cultures and Tribal communities, and supplies the energy to power our future.

Bureau of Reclamation

The mission of the Bureau of Reclamation is to manage, develop, and protect water and related resources in an environmentally and economically sound manner in the interest of the American public.

Washington State Department of Ecology

The Mission of the Washington State Department of Ecology is to protect, preserve and enhance Washington's environment, and promote the wise management of our air, land, and water for the benefit of current and future generations.

1.0 Background and Purpose

Under contract to the US Bureau of Reclamation (Reclamation), HDR Engineering, Inc. (HDR) has recently prepared an updated conceptual design for the Kachess Drought Relief Pumping Plant, Floating Pumping Plant Alternative. In late 2016, HDR, along with subconsultant Orion Marine Group (OMG) prepared an opinion of probable construction cost (OPCC) for an earlier conceptual design for this alternative. The purpose of this technical memorandum is to document the approach used and results of the HDR Team's preparation of an updated OPCC reflecting the additional information developed during update of the conceptual design. The current updated OPCC has been prepared based on the attached set of thirty (30) drawing sheets (Attachment A) that present the updated conceptual design.

In addition to the development of the drawing set, on Wednesday, October 25, 2017 the senior members of the design team met and held a Construction Plan Workshop. The significant challenge of constructing fixed project features on the floor of the reservoir was discussed, along with discussions of how to construct the floating project features on a reservoir whose water surface elevation can experience changes of up to 80 vertical feet each year. Major construction activities, durations and sequences were developed along with an estimation of the number of "spreads" that would be needed to accomplish the marine construction activities.

A spread is the temporary barge structure that is assembled on-site for construction purposes and consists of a crane located atop a set of floats that is used on the water during construction and subsequently disassembled and removed from the project site once construction is completed. It was determined that two separate spreads would be required for construction of this project alternative. A 2-year-long Construction Schedule is envisioned for this alternative and this schedule is presented in Attachment D.

1.0 Approach

For this current OPCC development effort, HDR and OMG each prepared an independent OPCC based on the attached conceptual design drawing sheets. The independently prepared OPCC by HDR Constructors and OMG are contained in Attachments B and C, respectively. A summary comparison of the two OPCCs is contained in Table 1.

Table 1. OPCC Comparison

Bid Item	Description	QTY	Unit	LH	ORION	LH	HDR	DELTA

* = Contains deferred future costs for construction of the lower portion of the Narrows Fish Passage Structure and the Public Boat Ramp.

On January 23, 2018, the lead estimators from HDR and OMG met with the HDR project manager to reconcile the differences between the two independently prepared OPCC's. Together, they collectively conducted an in-person reconciliation exercise by comparing the two independently prepared OPCCs. Each line item of each OPCC was compared, reviewed and discussed. If a large difference existed for a given line item, then the group closely examined how the number was developed and discussed what assumptions were used in the development of the line item cost. If there was a cost that was reasonably supported by both parties but the resulting cost was different; either the average of the costs was used or the bid item cost was reevaluated to identify the difference in the costs. In several instances the final cost that was reconciled was different, but not necessarily larger than either of the estimates. Additionally, there were assumptions that were identified which moved costs from one bid item to another. Table 2 – reconciled OPCC presents the final results of the fully reconciled OPCC.

TOTAL DIRECT COSTS		**$65,769,000**
PROJECT INDIRECT COSTS		
Project Indirect (Overhead)	7.5%	$4,932,675
Project Indirect (GC's)	5.0%	$3,288,450
SUBTOTAL DIRECT PLUS INDIRECT COSTS		**$73,990,125**
OTHER INDIRECT COSTS		
Contractor's Alternative Delivery Fee	12.0%	$8,878,815
Contractor's Bonds & Insurance	2.0%	$1,479,803
WA State Sales Tax (unincorporated Kittitas Co)	8.0%	$5,919,210
B&O Tax	0.5%	$369,951
Builders Risk Insurance	1.0%	$739,901
SUBTOTAL OTHER INDIRECT COSTS		$17,387,679
TOTAL ALL DIRECT + INDIRECT COSTS		**$91,377,804**
Engineering and Design Costs (2018)	12.0%	$10,965,336
Construction Contingency (2020)	25.0%	$24,237,963
Escalation of Project to Midpoint Construction [A] (2020)	6.1%	$5,574,046
Total Project Cost [B]		**$132,155,149**

[A] The inflation factor used in the reconciled OPCC is 6.1 percent versus a 5 percent inflation factor used in the two un-reconciled OPCCs. The author believes the 6.1 percent inflation factor is more representative of current inflation estimates.

[B] Does not include the deferred future costs required to construct the lower portion of the Narrows Fish Passage Structure ($43.4 M in 2020$) and the lower portion of the Public Boat Ramp ($3.0 M in 2020$). However, these costs must be taken into consideration for project economics and financing as these two features must be built; but at an as-yet unknown time in the future.

2.0 Separation of Costs for Deferred Future Construction from Initial Construction

There are two future construction actions that cannot be constructed during the initial construction of the drought relief pumping plant project. The two future construction actions that must be deferred are:

1. Extension of the Public Boat Ramp on the east shore of the reservoir.
2. Extension of the Volitional Fish Passage Structure located at the downstream end of the Narrows.

The reason these two construction actions cannot be accomplished during the initial construction phase lies in the fact that the reservoir cannot be physically lowered below the elevation of the existing gravity outlet works (El 2192.75) until after:

1. The drought relief pumping plant has been constructed and is operational.
2. An actual drought occurs and is officially declared to be such. Also, it will most likely require a multi-year drought to occur for both the Public Boat Ramp and the Volitional Fish Passage Structure to be completed in their entireties to their deepest elevations in the reservoir (down to elevation 2113.0).

It is not possible to know in advance if either a single year drought or a multi-year drought will occur. Thus, it will not be possible to schedule out with any certainty when the completion of these two project features will occur in the future. For this reason, the line item costs for these two items have been removed from the original construction contract of this OPCC; as it represents the estimated costs for the initial construction contract only.

Table 2 does not include the deferred costs for construction of the lower portion of either the Narrows Fish Passage Structure ($43.4 M in 2020$) or the lower portion of the Public Boat Ramp ($3.0 M in 2020$). However, these costs must be taken into consideration for project economics and financing as these two features must be built; but at an as-yet unknown date in the future.

Tables 3 and 4 present calculation of the deferred costs for the lower portion of the Narrows Fish Passage Structure and the lower portion of the Public Boat Ramp, respectively.

Table 3. Deferred Costs – Narrows Upstream Fish Passage Structure

TOTAL DIRECT COSTS (HDR, M. Garello)		**$21,816,000**

Escalation of Project to Midpoint Construction (2020)	6.1%	$127,128
Total Deferred Public Boat Ramp Costs		**$2,982,295**

3.0 Results

The reconciled OPCC resulting from the discussions at the reconciliation meeting held on January 23, 2018 along with additional line item input that resulted from a few follow-up activities that were determined to be needed during the meeting are presented in Table 2. The calculated Total Construction Cost for the reconciled OPCC for the project without the costs of the deferred future construction actions is $132.2 million in 2020 dollars.

At the current level of design, this OPCC is considered a Class 4 cost estimate (i.e. having a maturity level of project definition ranging from 1 percent to 15 percent). A Class 4 cost estimate will have an expected accuracy range having a Low that falls between -15 percent to -30 percent; and a High that falls between +20 percent to +50 percent. The authors place the maturity level of project definition for the Floating Pumping Plant Alternative at approximately 10 percent at present. Correspondingly, the authors have applied an expected range of accuracy to the calculated OPCC of a Low of -25 percent and a High of +40 percent. The basis of this range of accuracy is the AACE International Recommended Practice No. 18R-97, Cost Estimate Classification System – as Applied in Engineering, Procurement and Construction for the Process Industry (Revised March 1, 2016). Applying these accuracy ranges to the calculated OPCC amount of $132.2 million results in a cost range falling between a Low of $99.1 million and a High of $185.1 million.

As presented in Tables 3 and 4, the OPCC for the deferred construction contract costs is $46.4 million in 2020 dollars. Applying the same accuracy ranges (a Low of -25 percent and a High of +40 percent) to the deferred construction costs results in a cost range for the deferred construction costs falling between a low of $34.8 million and a high of $65.0 million.

Table 5 presents the results of the OPCC estimate contained in this memorandum for: 1) the original construction contract costs only; 2) the deferred construction contract costs only; and, 3) the original construction contract costs plus the deferred construction contract costs (all in 2020 dollars).

Table 5. Floating Pumping Plant Alternative Costs (in 2020$)

OPCC Name	Original Construction Contract Only ($Million)	Deferred Construction Contract Costs Only ($Millions)	Original Plus Deferred Construction Contract Costs ($Millions)
Low Range OPCC	$99.1	$34.8	$133.9
Computed OPCC	$132.2	$46.4	$178.6
High Range OPCC	$185.1	$65.0	$250.1

Roza Irrigation District

Kachess Reservoir Relief Pumping Plant

Basis of Estimate

Feasibility Study OPCC

November 30, 2017

Prepared For:

ROZA
IRRIGATION DISTRICT

Table of Contents

Attachments:

- Summary Roll-Up Estimate Report
- Work Area Estimate Report

Project History

In response to an anticipated continuation of the 2015 drought into the 2016 irrigation year Roza Irrigation District hired HDR to complete a four week reconnaissance study to determine the feasibility and primary design features of an emergency floating pumping plant on Lake Kachess. This facility was sized at Roza's request to deliver 150,000 acre-feet of water during a 70-80 day irrigation season. Ultimately this emergency plan was not enacted, and now a permanent floating pump station is under consideration. The permanent floating pump station will provide 200,000 Acre Feet (AF) of drought relief pumping volume at a rate of 1,000 Cubic Feet per Second (FPS). The design concept proposed will allow the permanent floating pump barge to drawdown the Big Kachess reservoir to a Water Surface Elevation (WSEL) of approximately 2,113'. At that elevation the reservoir would contain a pool volume of approximately 200,000 (AF). See Figure 1.

Scope of Work

The design concept for this facility consists of a custom engineered floating steel pump barge with three (3) 5,500 HP electric fired vertical turbine pumps. These pumps will discharge to pipes contained in a flexible end (with Cardanic Joints) trussed pipe bridge that will be fixed to the barge and to a rigid pipe bridge that will be supported by pipe pile supports. These pipelines will discharge water to a concrete flow control structure with a water jet impact slab. From the new flow control structure, water will enter the existing outlet channel and will utilize the existing gravity outlet works to convey flow to the Kachess River. Access to the discharge basin would be provided by upgraded existing public access road which connects to an existing National Forest road. An East Shore Boat Ramp Parking Area will be constructed along with marina facilities for use during construction and ultimately for long term operations, maintenance, and repair activities for the floating pump plant.

Dredging of existing reservoir (approximately 6,000 cy) to a depth of approximately 25 feet lower than the maximum drawdown elevation of the reservoir will be done to ensure acceptable vertical clearance to the suction bells of the pumping units is maintained. The dredged material will be returned to the reservoir floor and not brought to the surface for upland disposal.

A volitional fish passage facility with be constructed at the Kachess Narrows to allow passage of bull trout.

Power for the emergency floating pumping plant would be provided by a proposed 115-kV transmission line to a proposed switchyard (complete with storage building & yard) and a control building. The control building will be constructed on the East end of the existing Kachess Dam which is N.W. of the proposed switchyard. Power and I&C cabling from the control building to the floating pump station will be provided via marine cable installed at the approximate centerline of the existing outlet channel.

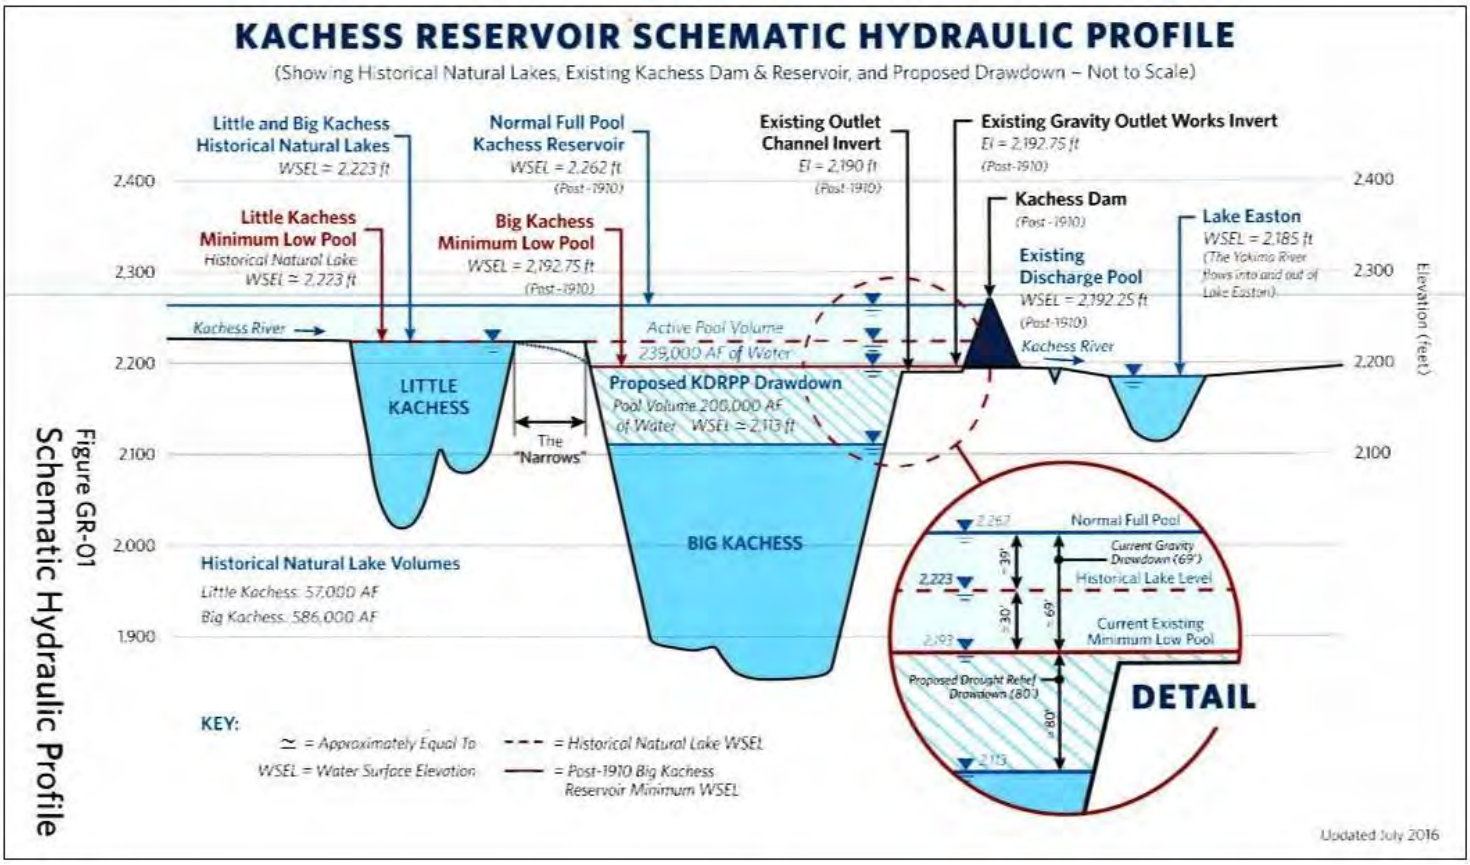

Figure 1: Hydraulic Profile Schematic

Method of Accomplishment

This estimate is based upon a single prime contractor self-performing portions of the work. All other scopes of work will be secured utilizing competitive subcontract procurement process. Major work scopes include: Site clearing and grading, barge fabrication and field erection, supply and installation of (three) pumps and all appurtenances, building erection and building trades, fish passage, boat ramp and docks, outlet structure, electrical, and instrumentation.

The contractor will staff the project with a team of qualified Construction Managers, Project Superintendents, Safety Manager, and QA/QC manager. A full time Project Manager will manage the project from the contractor's home office with support staff as necessary.

It is assumed that all work in the reservoir will be performed at optimum water level drawdown elevations. Every effort to work in dry conditions will be made by the contractor and its subcontractors to maximum labor productivity and efficiencies.

Project Schedule

The final project duration has not been established so for the purpose of this estimate we have assumed a 2 year construction period with Notice to Proceed on or around the middle of June 2018. Procurement of long lead time items will begin soon after the NTP on or around June 18, 2018. Construction will begin on or around March 11, 2019 with Substantial Completion on or around June 08, 2020.

Description	Start	Complete
Notice to Proceed	04 Jun 2018	04 Jun 2018
Procurement	18 Jun 2018	11Mar 2019
Construction	11 Mar 2019	08 Jun 2020
Demobilization	08 Jun 2020	22 Jun 2020

Figure 2 Anticipated Milestone Schedule

Estimate Methodology/Type

This estimate is based on the "Draft – KFPPA Project Description – SDEIS Concept Text" and the "KFPP DWGS Updated BK Redlines 2016-08-22" concept drawings along with additional drawings provided on 8-22-16 and updated ALT.3 – Floating Pumping Plant drawings provided on 11-6-2017. Estimating staff performed detailed analysis of all concept drawings and narratives. Detailed quantity takeoffs were performed, where necessary, utilizing Bluebeam Software. Sage Timberline Estimating Software was utilized for all labor, material and equipment price calculations.

The estimate utilizes RS Means labor rates for Yakima, WA. See Cost Data section for clarification. Material and equipment costs are adjusted utilizing the RS Means City Cost Index for Yakima, WA as well. Major Equipment pricing was provided to HDR and included vendor budgetary quotes specific to this project.

The estimate utilizes standard productivity installation rates from RS Means. These rates have been adjusted for local and site specific conditions.

Based on AACE guidance and review of the conceptual design documents and preliminary construction schedule, the estimate meets Class V methodology standards.

Figure 3 Construction Cost Summary

Cost Basis

This estimate utilizes the following financial data for all pricing included. The direct costs and indirect cost percentages are based on experience, current market conditions, and historical data.

Direct Cost Methodology

- A combination of HDR Constructors database pricing, similar project costs, and historical data were used to establish direct costs
- The HDRC database was indexed for Yakima, WA
- 2017 RS Means labor rates.
- All labor is done on normal 8 hour days, 5 days a week Monday thru Friday.
- Subcontractor pricing includes mark-ups of
    1. 10% Field Overhead/General Conditions
    2. 15% Home Office Overhead and Profit

Indirect Cost Methodology

- General Contractor Mobilization & Demobilization – 6%
    - Set up and removal of all temporary facilities, including contractor field office
    - Equipment necessary for self performed scopes of work
    - Mob/Demob of all necessary construction equipment
    - Training of all field and craft personnel

- General Contractor Field OH – 8%
    - Field OH includes, but is not limited to the following:
        - Field project staff and standard burden
        - Procurement
        - Project controls/scheduling
        - Full time QA/QC, safety, and environmental staffing

- General Contractor Field General Conditions – 5%
    - Field general conditions include, but are not limited to the following:
        - Site office facilities adequate for staff required to manage project site
        - Field office staff vehicles and equipment
        - SWPPP and minor maintenance of SWPPP measures
        - Project consumables
        - Temporary utilities
        - Temporary facilities

- Washington State Sales Tax – 8%
- Washington State B&O Tax – 0.484%

- General Contractor Fee – 12%
    - Profit based on:
        - Local market conditions
        - Size and scope of project
        - Contacting method
        - Project Risk

- Construction contingency – 25%
    - See Level of Confidence

- General Contractor Bonds & Insurance – 2.0%
    - Bonds & Insurance includes the following (under normal conditions):
        - 0.75% - Bonds
        - 0.75%- General Liability
        - 0.5%- Marine Construction

- The following allowances are included
    - Fish screening under barge
    - Grading Existing Rock from Turnaround to Outlet Channel
    - PSE Design/Review Fee's
    - Existing road repair at project completion

- The following 2016 budgetary pricing was provided to HDR from individual vendors for use in this estimate
    - Pumps, motors, and drives
    - VFD's (2017 Budgetary Pricing Obtained)
    - Electrical Gear
    - Barge Modules

Assumptions/Exclusions

Assumptions:

- This work will be completed uninterrupted, only one mobilization and demobilization.
- This project will be worked on a standard work week.
- Project to be competitively bid, not sole sourced with a minimum of three bids.
- All regulatory approvals will be obtained by others prior to mobilization
- Any/all environmental impact studies and associated permitting will be completed by others prior to mobilization.
- Subcontractors and trade labor can be procured locally or within a radius that does not require per diem upcharges.
- Location provides for sufficient lay-down and staging area.
- All procurements by the Joint Venture and its subcontractor's.
- All existing soils are suitable for re-use as backfill and any spoils will be spread on site.
- All start-up and testing to be done by vendors, sub-contractors under supervision of GC.
- Temporary construction power is available

Exclusions:

- Accelerated schedule costs
- All permits, regulatory fees, environmental fees or requirements and acquisition of such.
- Any off-site storage facilities.
- Around the clock site security measures
- Extended warranty costs
- Handling/disposal of any hazardous materials.
- Any rock excavation or excavation of unforeseen underground obstacles
- SWPPP and marine construction abatement costs.

Level of Confidence

This is a Class V estimate as defined by AACE. The margin of error for this estimate classification is L: -25% / H: +50. According to these guidelines and the stated classifications, construction contingency would fall between 25% - 40% based on the conceptual design documents. The estimate utilizes 2017 RS Means as a basis for labor and it is understood that labor rates may adjust in an unknown direction based on future market conditions. The estimate incorporates a 25% construction contingency to account for fluctuating market conditions, evolution of the equipment specifications, increases to the prevailing wages and general design and estimate omissions.

Escalation

Project escalation calculated for estimated procurement of long lead items (pumps) beginning one year in advance of the start of construction. Construction is currently assumed to begin in March 2019, with completion anticipated on or before June 08, 2020. The escalation for this project is calculated utilizing the Bureau of Labor Statistics cost indexes. See Figure 4.

Single Weighted Avg Escalation			
% of Year End Committed Costs	Year	Escalation	
60%	2018	2.23%	
20%	2019	6.13%	
20%	2020	10.20%	
100%			***4.60%***

Figure 4: Escalation Weighted Average
