

## LIST OF TABLES

Table 1	Samples of bed material from tributaries within or near the San Acacia Reach.
Table 2	Summary information for the San Acacia Reach terraces.
Table 3	Effective discharge calculations, USGS Rio Grande gage at San Acacia.
Table 4	Sub-reach description and lengths.
Table 5	Summary of active channel widths in feet, by year, as measured from the distance between riparian vegetation on historic aerial photos, San Acacia Reach.
Table 6	Classification assigned to each sub-reach by each model.
Table 7	Summary of reach average values for the San Acacia Reach as estimated from riparian boundaries on the historic photographs, and by the HEC-RAS and STARS models.
Table 8	Summary of sub-reach 1 average values for the San Acacia Reach as estimated from riparian boundaries on the historic photographs, and by the HEC-RAS and STARS models.
Table 9	Summary of sub-reach 2 average values for the San Acacia Reach as estimated from riparian boundaries on the historic photographs, and by the HEC-RAS and STARS models.
Table 10	Summary of sub-reach 3 average values for the San Acacia Reach as estimated from riparian boundaries on the historic photographs, and by the HEC-RAS and STARS models.
Table 11	Summary of sub-reach 4 average values for the San Acacia Reach as estimated from riparian boundaries on the historic photographs, and by the HEC-RAS and STARS models.
Table 12	Grain sizes ( $d_{84}$ ) throughout the San Acacia Reach.
Table 13	Summary of gravel layer characteristics by sub-reach.
Table 14	Volume of sediment removed by bed lowering (degradation) for each sub-reach in the San Acacia Reach, as determined by cross section comparisons.
Table 15	Summary of Sediment Transport Zones, San Acacia Reach.
Table 16	Current Conditions of Channel Parameters for each Transport Zone, San Acacia Reach.
Table 17	Summary of average water surface slopes, San Acacia Reach (1962-1999).
Table 18	Computed stable slopes for sand and gravel sized sediment for San Acacia Reach.
Table 19	Computed stable width and EG slopes for the current channel conditions and sediment supply for flows of 5,000 cfs: San Acacia Reach.

- Table 20 Grain sizes present, estimated sizes of grain mobile during a 5,000 cfs discharge and the specific discharge required to mobilize the current grains on the channel bed in the San Acacia Reach
- Table 21 Average future conditions for sub-reach 3 based on a slightly meandering, gravel bedded channel, San Acacia Reach.
