INTRODUCTION

This Environmental Assessment (EA) has been prepared in compliance with the National Environmental Policy Act (NEPA) to evaluate the environmental effects of C Ditch Company’s proposed C Ditch/Needle Rock Pipeline Project (hereinafter, “Project” or “Proposed Action”). Rare Earth Science, LLC prepared this EA on behalf of the U.S. Department of the Interior’s Bureau of Reclamation (hereinafter “Reclamation”), which is authorized by the Colorado River Basin Salinity Control Act to provide funding assistance for the Proposed Action. Reclamation awarded a funding agreement to C Ditch Company for the Project in July 2012 (Agreement Number R12AC40002, hereinafter, “Funding Agreement”).

This EA represents a coordinated screening and analysis of the environmental effects of the Proposed Action and a “No Action” Alternative. If Reclamation’s review of this EA results in a Finding of No Significant Impact for the Proposed Action, preparation of an Environmental Impact Statement would not be required before the Proposed Action could be implemented.

1.1 Proposed Action

The Proposed Action (described in more detail in Section 2.1) entails replacing a total of approximately 14,669 lineal feet (approximately 2.78 miles) of open irrigation ditch with buried pipe, both to improve the efficiency of water delivery to ditch users, and to reduce salinity loading in the Colorado River Basin. Approximately 12,308 lineal feet of C Ditch (aka Lower Needle Rock Ditch or LNRD) and approximately 2,361 lineal feet of the C Ditch Laterals (aka the Hoff and Adam-Davis Extensions) will be piped.

The Proposed Action will be located in Delta County, Colorado, about 3 miles north of the Town of Crawford, in the Cottonwood Creek drainage (Figure 1). Cottonwood Creek is a tributary of the North Fork of the Gunnison River in the lower Gunnison River watershed of the upper Colorado River basin. Part of the land involved in the Proposed Action is privately owned, and part of the land involved in the Proposed Action is administered by the U.S. Bureau of Land Management’s (BLM’s) Uncompahgre Field Office (Figures 1 and 2).

The Proposed Action Area is situated in soils derived from Mancos Shale, a saline marine deposit, which contributes salts to irrigation water that leaks from unlined irrigation ditches. According to Reclamation, the estimated salt load reduction in the Colorado River Basin resulting from the Proposed Action will be 1,284 tons per year. Conceptual and project plans were developed by C Ditch Company with assistance from Harward Irrigation Systems.

1.2 Background

The Colorado River and its tributaries provide municipal and industrial water to about 27 million people and irrigation water to nearly four million acres of land in the United States. The river also serves about 2.3 million people and 500,000 acres in Mexico. The threat of salinity loading in the Colorado River basin is a major concern in both the United States and Mexico. Salinity affects agricultural, municipal, and industrial water users.

In June 1974, Congress enacted the Colorado River Basin Salinity Control Act, Public Law 93-320, which directed the Secretary of the Interior to proceed with a program to enhance and protect the quality of water available in the Colorado River for use in the United States and
Republic of Mexico. In October 1984, Congress amended the original act by passing Public Law 98-569.

Public Law 104-20 of July 28, 1995, authorizes the Secretary of the Interior, acting through the Bureau of Reclamation, to implement a basinwide salinity control program. The Secretary may carry out the purposes of this legislation directly, or make grants, enter into contracts, memoranda of agreement, commitments for grants, cooperative agreements, or advances of funds to non-federal entities under such terms and conditions as the Secretary may require.

Reclamation’s Basinwide Salinity Control Program funds salinity control projects with a one-time grant that is limited to an applicant’s competitive bid. Once constructed, the facilities are owned, operated, maintained, and replaced by the applicant at their own expense. The C Ditch/Needle Rock Project signed a cooperative funding agreement with Reclamation in September 2011 (Agreement Number R12AC40002), with a targeted project completion date of 2015.

1.3 Need For & Purpose of Proposed Action

Seepage from unlined leaking irrigation ditches in the region is a significant source of ground water which mobilizes naturally-occurring salts in the Mancos Shale-derived soils and underlying shale formations. Construction of the Proposed Action will provide a buried pipe delivery system to replace existing unlined ditches, which will eliminate seepage and reduce salinity in the Colorado River basin by an estimated 1,284 tons of salt per year. This will provide benefits for a broad spectrum of interests, including downstream water users, environmental interests, and local, state, and federal government agencies.

1.4 Scoping & Coordination

Scoping for this Environmental Assessment was completed by Reclamation during the initial planning stages of the project to 1) determine the alternative action(s) to be evaluated; 2) to determine the significant issues of analysis triggered by the Proposed Action; and 3) to guide consultation and coordination with other agencies to ensure compliance with NEPA.

During scoping, Reclamation and C Ditch Company limited the project alternatives to the “Proposed Action” and “No Action” alternatives (discussed in Section 2). Additionally, Reclamation identified the potential environmental and human environment issues and concerns associated with implementation of the Proposed Action. The following issues were determined to be insignificant or not applicable, and are not analyzed further in this EA:

- **Indian trust assets** (not applicable). Indian trust assets may include lands, minerals, hunting and fishing rights, traditional gathering grounds, and water rights. No Indian trust assets have been identified within the project area. Therefore, neither the No Action nor the Proposed Action alternative will have an effect on Indian trust assets.

- **Environmental justice issues** (not applicable). Executive Order 12898 provides that federal agencies analyze programs to assure that they do not disproportionately adversely affected minority or low income populations or Indian Tribes. The project area does not occur on Indian reservation lands or within disproportionately adversely affected minority or low income populations. Therefore, neither the No Action nor the Proposed Action alternative will have an environmental justice effect.
• Jurisdictional wetlands (not applicable). The Proposed Action will affect surface and subsurface hydrology supplied to wetland areas along the project alignment. As an irrigation maintenance project, the Proposed Action is exempt from requiring a Section 404 Permit pursuant to the Clean Water Act (33 USC 1344). The applicable U.S. Army Corps of Engineers exemptions are for 1) Farm or Stock Pond or Irrigation Ditch Construction or Maintenance, and 2) Maintenance of Existing Structures. The exemptions have been confirmed by Nathan Green in the Grand Junction Regulatory Office of the U.S. Army Corps of Engineers. Copies of the Exemption Summaries are provided as Attachment B.

Issues determined to be of potential significance, and therefore appropriate for analysis under this EA, are outlined below and discussed in greater detail in Section 3:

• Water Rights. The ditches involved in the Proposed Action provide water for irrigation. Piping of these ditches is not expected to interfere with operations or adversely affect the ability to use water for irrigation.

• Water Quality. Piping existing ditches is expected to benefit water quality by reducing salinity and selenium loading in the Colorado River basin. There are additional water quality benefits beyond salinity reduction.

• Access & Land Use. The project lies partially on private lands and partially on public lands administered by BLM. C Ditch Company is responsible for obtaining all needed right-of-way and landowner consent prior to construction of the project. Temporary reclaimable land disturbance, and a permanent cut in an existing rock hillside, will result from construction.

• Recreation and visual resources. The Proposed Action is located partially on BLM lands with visual resources and opportunities for public recreation near impacted project area. Temporary reclaimable land disturbance will result from construction.

• Livestock grazing. The Proposed Action is located partially on BLM lands in cattle and sheep grazing allotments. Temporary reclaimable land disturbance will result from construction within the grazing allotments, and the Proposed Action would remove a source of livestock water on the grazing allotments.

• Fish & Wildlife Resources. Public Laws 98-569 and 104-20 require that the Secretary of the Interior “shall implement measures to replace incidental fish and wildlife values foregone” and the development of a program that “shall provide for the mitigation of incidental fish and wildlife values that are lost as a result of the measures and associated works and the replacement of fish and wildlife values foregone.”

• Threatened & Endangered Species. The Endangered Species Act (ESA) requires federal agencies to consult with the U.S. Fish & Wildlife Service to ensure any actions they authorize or fund do not cause jeopardy to threatened or endangered species. No new adverse effects to species listed under the Endangered Species Act are expected as a result of implementation of the Proposed Action. Reclamation will consult with the U.S. Fish & Wildlife Service regarding historic water depletions in the Gunnison basin resulting from the operation of C Ditch, and water quality improvements resulting from the Proposed Action, as they relate to the Gunnison Basin Programmatic Biological
Opinion (the Biological Opinion addresses downstream critical habitat for endangered fish species).

- **BLM Sensitive Species.** The Proposed Action is located partially on BLM lands managed by BLM’s Uncompahgre Field Office (UFO). According to BLM Manual Part 6840, BLM Sensitive species (in addition to those proposed for listing under the federal ESA) are “species requiring special management consideration to promote their conservation and reduce the likelihood and need for future listing under the ESA.” BLM Sensitive species are designated by the BLM’s state director. Temporary effects to certain BLM Sensitive species may result from implementation of the Proposed Action, however, these effects will be mitigated in a habitat replacement area located near the Proposed Action (as described elsewhere in this EA).

- **Cultural Resources.** Federal agencies are responsible for ensuring that they take into account the effects of their actions on significant cultural resources and for complying with the National Historic Preservation Act (36 CFR Part 800) and other historic preservation requirements.

- **Agricultural Resources.** The U.S. Department of Agriculture’s Natural Resources Conservation Service identifies farmlands of national and statewide importance (prime and unique farmlands) in the region, based on soil types and irrigation water resources. Temporary disturbance to agriculturally significant lands will occur during construction, and these lands will be returned to production immediately following the project.

### 1.5 Agency Consultations

In compliance with NEPA and in the interest of addressing environmental issues identified during the scoping process, the following agencies were contacted and consulted in the preparation of this document:

- U.S. Bureau of Land Management, Uncompahgre Field Office, Montrose, CO
- Colorado Office of Archaeology and Historic Preservation, Denver, CO
- Colorado Water Conservation Board, Denver, CO
- Colorado Division of Water Resources, District 40 (North Fork), CO
- Colorado Parks & Wildlife, Gunnison, CO
- U.S. Fish & Wildlife Service, Ecological Service, Grand Junction, CO
- U.S. Army Corps of Engineers, Regulatory Office, Grand Junction, CO

The contact list for agencies consulted during the EA process (also the distribution list for this EA) is included as Attachment A.

### 2 PROPOSED ACTION & ALTERNATIVES

Alternatives evaluated in this EA include a No Action Alternative and the Proposed Action.

#### 2.1 No Action Alternative

Under this alternative, Reclamation would not provide funding to C Ditch Company to pipe C Ditch and a C Ditch Lateral. Seepage from these structures would continue to contribute to salt
and selenium loading in the Colorado River basin. Riparian and wetland habitats associated with the ditches would likely remain in place and continue to provide benefits to local wildlife.

### 2.2 Proposed Action Alternative

Reclamation, through the Colorado River Basin Salinity Control Program (CRBSP) has funded C Ditch Company (Agreement Number R12AC40002) to pipe open irrigation ditches to reduce salt loading in the Colorado River basin. Ditches to be piped include C Ditch (aka Lower Needle Rock Ditch) and two C Ditch laterals (the Hoff Extension and the Adam-Davis Extension). Construction for the Proposed Action would take place between October 1, 2013 and April 15, 2014. Construction details can be found in detailed construction drawings and a project overview narrative by Harward Irrigation (as summarized below).

Table 1, below, summarizes the approximate project components. The Proposed Action will replace a total of approximately 14,669 lineal feet (2.78 miles) of open irrigation ditch with buried pipe, installed in or next to the exiting ditch prism. Pipe diameters would range from 28 inches to 8 inches. A screen structure and intake will be built at or near the exiting headgate for C Ditch on Cottonwood Creek. Each of 11 farm turnouts will include a metered outlet.

A total of approximately 3,920 lineal feet of the Proposed Action crosses BLM lands (see Figures 1 through 4): about 3,090 lineal feet cross BLM lands in the east part of the Proposed Action Area, and about 830 lineal feet cross BLM lands in the west part of the Proposed Action Area. A construction right-of-way has been requested on BLM lands consisting of 60 feet on the south side of the existing ditch alignment and 20 feet on the north side of the existing ditch alignment. A maintenance / permanent right-of-way has been requested on BLM lands consisting of 20 feet from project centerline on the south side and 10 feet from project centerline on the north side.

Four construction staging areas for materials have been identified for the Proposed Action (Figures 2 and 3). All staging will take place on private lands in agricultural areas or on previously disturbed ground, except for the east-most staging area, which will lie on BLM land. The staging area on BLM land will consist of an approximately 100-foot by 200-foot (approximately 0.5 acre) graded pad near the existing diversion structure on Cottonwood Creek. The graded pad will be located in a relatively flat area, partially on the existing BLM road, in an area that was historically disturbed during the construction of the existing diversion structure. This location and placement of this staging area is necessary to allow for long strings of pipe to be built prior to their transport into the east part of the project alignment, which has limited space for safe operation of equipment.
All access ways for construction of the Proposed Action will be on county roads or existing private roads, except for access to the east part of the Proposed Action Area, which will be from an existing road crossing both private and BLM land (Figures 2 and 3). This road, which is approximately 1,495 feet long (with 920 feet on BLM land and 575 feet on private land), will require grading up to 12 feet wide to allow for safe access of vehicles, materials, and equipment. The road alignment will be graded to allow for proper drainage. In the west part of the Proposed Action Area, access to the construction right-of-way on BLM land will be from Davis Road (a county road).

When construction is complete, the abandoned ditch will be in-filled with soil from the berm paralleling the canal, and irrigation structures (head gates, drops, etc.) will be removed. Any rock material generated from project construction in the east part of the Proposed Action Area on BLM land will be hauled off site or used as rip-rap within the Proposed Action Area.

Vegetation slash will be chopped and deposited along the project alignment as mulch. Revegetation and weed control complying with BLM right-of-way permit conditions and Delta County standards will be implemented as soon as practicable following construction.

3 AFFECTED ENVIRONMENT & ENVIRONMENTAL CONSEQUENCES

This section discusses resources that may be affected by actions taken to pipe approximately 2.78 miles of C Ditch and a C Ditch lateral. During preparation of this EA, information on issues and concerns was received from the Ditch Company, resource agencies, and other interested parties, as noted in the subsections below.

For each resource, the potentially affected area and/or interests are identified, existing conditions described, and impacts predicted under the No Action and Proposed Action Alternatives. This section is concluded with a summary of impacts.

3.1 Description of the Proposed Action Area

The Proposed Action Area lies in the North Fork of the Gunnison River (North Fork River) Valley, about 150 miles southwest of Denver, in Delta County, Colorado. The climate is semi-arid continental, with low humidity and moderately low precipitation, averaging about 10 to 13 inches annually. The average elevation in the Proposed Action Area is about 6,000 feet above mean sea level (Figure 2). Typical crops are irrigated grass pasture and hay crops. The irrigation season is approximately 153 days long.

The ditches subject to Proposed Action are privately owned irrigation conveyances charged by water diverted from two sources: Cottonwood Creek at a location approximately 2.8 direct miles north-by-northeast of the Town of Crawford, and from Aspen Canal, which intersects C Ditch approximately 0.9 mile downstream of the C Ditch origin on Cottonwood Creek (Figures 2 and 3). C Ditch and the short C Ditch lateral involved in the Proposed Action deliver irrigation water to shareholders from Cottonwood Creek during May through July. As flows diminish in Cottonwood Creek, supplemental water is ordered from Crawford Reservoir and transferred from Aspen Canal into C Ditch. A total of approximately 460 acres of grass pasture and hay crops are served. Drainage from the service area flows back to Cottonwood Creek which drains to the North Fork River (Figure 3). The Proposed Action area begins at the C Ditch origin on
Cottonwood Creek, and extends to the end of C Ditch near the intersection of Davis and Crawford Roads (Figure 2).

The Proposed Action Area consists partially of rural farms on private lands with irrigated hay meadows and pastures and partially of BLM lands in relatively natural vegetation (see Figures 3 and 4), all occurring on Mancos Shale-derived soils. On-farm irrigation is accomplished primarily using gated pipe or sprinkler systems. Prior to conversion to irrigation conveyances, the Proposed Action Area consisted primarily of sagebrush and desert scrublands or pinyon-juniper woodlands. Areas adjacent to ditches and receiving leakage from the ditches have converted to riparian and wetland habitats, and some natural wetlands receiving ditch leakage have likely been enhanced.

Figure 4 shows the major landcover types mapped in the area by the Southwest Regional Gap Analysis Project (SWReGAP 2004). The primary landcover types in the Proposed Action Area are irrigated agricultural and Colorado Plateau pinyon pine-Utah juniper woodlands. Other landcover types intersecting or existing near the ditches / planned buried pipeline alignments involved in the Proposed Action are minor amounts of Inter-mountain Basins big sagebrush shrubland, Rocky Mountain Gambel oak-mixed montane shrublands, and Inter-mountain Basins semi-desert grassland (see Section 3.5). The existing ditch alignments are vegetated mostly with coyote willow and occasional mature cottonwoods, but also support stands of common ruderal and noxious weeds.

3.2 Water Rights & Use

C Ditch originates at head gate on Cottonwood Creek at a location approximately 2.8 direct miles north-by-northeast of the Town of Crawford, and terminates at the intersection of Crawford Road and Davis Road approximately 2.5 miles west of its origin. C Ditch provides 10 users with irrigation and stock water. The irrigation season is approximately 153 days long. Total average rate of annual diversions of irrigation water through C Ditch is approximately 5,270 acre-feet per year, with a breakdown as follows:

- **Cottonwood Creek water right**: The absolute total decreed water right (for irrigation and stock water) for this head gate (structure #1729, 1730, 1731) is 12.5 cubic feet per second (cfs), and the average annual through-put resulting from this water right is 3,156 acre-feet for irrigation, and 1,272 acre-feet for winter stock water.

- **Crawford Reservoir water right**: When flows diminish in Cottonwood Creek during irrigation season, supplemental water is called from Crawford Reservoir and transferred to C Ditch via the Aspen Canal (structure #509), which intersects C Ditch approximately 0.9 mile downstream of its Cottonwood Creek headgate. The total absolute water right for shareholders of C Ditch Company from Crawford Reservoir is 788 acre-feet per year. The average annual through-put, according to the Funding Agreement is 630 acre-feet per year for irrigation and 212 acre-feet for winter stock water.

Attachment C contains “Structure Summary Reports” for the Cottonwood Creek headgate (structure #1729, 1730, 1731) and Aspen Canal (#509). The reports summarize total water rights associated with the structure (including amounts decreed, appropriation dates, priority information, and adjudication type) and were generated using the Colorado Department of Natural Resources Water Conservation Board Decision Support Systems online reporting tools (CWCB 2013).
Cottonwood Creek, a North Fork of the Gunnison River (North Fork River) tributary, and Iron Creek (Crawford Reservoir) a Smith Fork River tributary, lie within the Gunnison River basin. The Gunnison River basin is approximately 7,800 square miles in size. Information on water rights within the Gunnison basin in general can be found in the report entitled “Gunnison River Basin Information, Colorado’s Decision Support Systems” (CWCB 2004).

Proposed Action: under the Proposed Action Alternative, C Ditch Company would have the ability to better manage its water rights with efficiencies gained from piping the system. Efficiencies gained may result in more water availability during irrigation season. Therefore, no direct adverse effects on water rights in the Gunnison River Basin are expected to occur due to implementation of the Proposed Action.

No Action: the No Action Alternative would have no direct effect on water rights and uses within the Gunnison River Basin. The water delivery system would continue to function as it has in the past.

3.3 Water Quality

The Proposed Action is located with the North Fork of the Gunnison River watershed in west-central Colorado. The North Fork River flows through northwestern Gunnison and Delta Counties, beginning at the confluence of Muddy Creek and Anthracite Creek downstream of Paonia Dam and flowing southwesterly approximately 33 miles to its confluence with the Gunnison River west of the Town of Hotchkiss. The North Fork watershed (HUC 1402004) drains approximately 986 square miles and includes five small communities that line the North Fork as it flows west towards the Gunnison River. Cottonwood Creek drains the Proposed Action Area (Figure 3) and enters the North Fork upstream of the Town of Hotchkiss. Water from Crawford Reservoir (also in the North Fork of the Gunnison River watershed) is transported to the Proposed Action Area and eventually returns to the Cottonwood Creek drainage. Stream segments and Water Quality Standards for these waters are shown in Table 2, below.

Currently, the North Fork River, Cottonwood Creek, and Crawford Reservoir are not on the Colorado Department of Public Health and Environment’s (CDPHE’s) list of impaired waters in the State of Colorado (CDPHE 2012). However, as mentioned in Section 1.3, seepage from unlined leaking irrigation ditches in the region is a significant source of water which mobilizes naturally-occurring salts and selenium in the Mancos Shale-derived soils and underlying shale formations into the local river system. Construction of the Proposed Action will provide a buried pipe delivery system to replace existing unlined ditches, which will eliminate seepage and reduce salinity in the Colorado River basin by an estimated 1,284 tons of salt per year. The Proposed Action is also expected to reduce selenium loading into the Gunnison River basin (a goal of the Gunnison Basin Selenium Management Program [SMPW 2011]); however, these benefits have not been quantified.

The Colorado River basin provides municipal and industrial water to about 27 million people and irrigation water to nearly four million acres of land in the United States. The river also serves about 2.3 million people and 500,000 acres in Mexico. The threat of salinity loading in the Colorado River basin is a major concern in both the Unites States and Mexico. The Proposed Action and other similar projects in the region are contributing significantly to salinity reduction in the Colorado River basin.

</tbody>
</table>

(a)=Acute; (c)=Chronic; TVS=Table Value Standards; Trek=Total Recoverable Fraction; *=temporary modification

Data from Water Quality Control Commission Regulations 31 (CDPHE 2009) and Regulation 35 (CDPHE 2013).

Official designated uses for the North Fork River include domestic potable water supply, livestock and wildlife water supply, aquatic habitat and aquatic harvest, human contact (incidental contact through submersion), and agricultural water supply. Official designated uses for Cottonwood Creek and Crawford Reservoir are warm aquatic habitat, recreation, and agricultural water supply. Maintenance or improvement of water quality in the North Fork River and Cottonwood Creek segments would be of significant importance to users of these water resources.

Proposed Action: Because construction activities will occur within the dry canal or lateral, no change in water quality during construction is predicted. Exemptions under the Clean Water Act apply to the Proposed Action (see Attachment B); therefore no Section 401 Water Quality Certification is required for the Proposed Action. Improvements to water quality in the North Fork River and Cottonwood Creek (and in turn, the Gunnison River and Colorado River basins) are likely to result from implementation of the Proposed Action. An estimated salt loading reduction of 1,283 tons per year to the Colorado River basin will result from implementation of the Proposed Action. The Proposed Action is also expected to reduce selenium loading into the Gunnison River basin (a goal of the Gunnison Basin Selenium Management Program [SMPW 2011]); however, these
benefits have not been quantified. Improved water quality would likely benefit
downstream aquatic species by reducing salt and selenium loading in the North Fork,
Gunnison, and Colorado rivers. No change in water quality would occur to Crawford
Reservoir (which is upgradient of the Proposed Action Area) as a result of the Proposed
Action.

No Action: under the No Action Alternative, no change to existing water quality trends is
predicted. The estimated 1,283 tons of salt annually contributed to the Colorado River
basin would continue. Current selenium loading levels would continue in the Gunnison
basin.

3.4 Access & Temporary Disturbance

During construction of the Proposed Action, an increase in noise and traffic would occur. Access
for construction, operations and maintenance would utilize existing roadways. C Ditch Company
would obtain easements where necessary for improvements and pipeline alignments.
Temporary disturbances within the right-of-way and footprint of the pipeline would occur during
construction and the existing ditches and laterals would be dewatered and modified so that they
no longer transport irrigation water. A permanent cut in a rock slope on BLM lands in the east
part of the Proposed Action Area would result from construction. Pipeline alignments and
construction footprints would be revegetated subject to BLM right-of-way permit conditions and
agreements between C Ditch Company and individual land owners. Rock generated from the
cut slope would be hauled offsite or used for rip-rap within the Proposed Action Area. To date,
all landowners in the footprint of the Proposed Action have agreed to provide access for the
proposed buried pipeline alignment as shown on Figures 2 and 3.

Proposed Action: The Proposed Action would cause short-term temporary adverse
effects consisting of noise, ground, and vegetation disturbance to property owners in the
Proposed Action Area. This disturbance would occur incrementally across the Proposed
Action Area during the timeframe of October 1, 2013 through April 15, 2014. In the east
part of the Proposed Action Area (on BLM land), it will be necessary to scale back
hillslopes above (south of) certain parts of the Project Alignment in order to create a safe
work platform for construction. Scaled slopes will be similar in appearance to the original
slopes, which are currently mostly unvegetated Mancos shale-derived soils and rock.
Rock derived from scaled slopes will be used as rip-rap at the intake structure at the
east end of the pipe alignment and/or elsewhere within the Proposed Action Area. Soil
will be used to backfill the existing ditch after the pipe is placed. Excess rock and soil
material will be transported out of the Proposed Action Area and used as clean fill on
private property (to improve upland or agricultural areas). Construction of the Proposed
Action could result in creation of a new unintentional access route for recreational use on
BLM land, and could lead to trespass on adjoining private lands crossed by the
Proposed Action. Private landowners adjoining the Proposed Action Area would be
responsible for posting their property boundaries. BLM will stipulate that once the
Proposed Action is constructed, a sign will be posed near the inlet structure stating that
the “route” along the project right-of-way is “Administrative Access Only” (no motorized
access will be permitted along the pipeline route, except by C Ditch Company and BLM).

No Action: the No Action Alternative would have no effect on existing access easements,
current agreements, or current land uses.
3.5 Habitat

As described in Section 3.1, the primary landcover types in the Proposed Action Area are irrigated agricultural and Colorado Plateau pinyon pine-Utah juniper woodlands. Other landcover types intersecting or existing near the ditches / planned buried pipeline alignments involved in the Proposed Action are minor amounts of Inter-mountain Basins big sagebrush shrubland, Rocky Mountain Gambel oak-mixed montane shrublands, and Inter-mountain Basins semi-desert grassland (Figure 4).

The pinyon pine-Utah juniper woodland association, intermixed with Rocky Mountain Gambel oak, mixed montane shrubs, and big sagebrush, exists along the eastern approximately 6,000 lineal feet of the Proposed Action Area. Approximately 4,000 lineal feet of this segment of wooded lands are administered by BLM, and about 2,000 feet are on private property. The central approximately 3,500 feet of the Proposed Action Area intersects agricultural (farmland) ground. The western end of the project area crosses mixed sagebrush and Inter-mountain Basin semi-desert grassland vegetation types (Figure 4).

The existing ditch alignment is vegetated mostly with coyote willow, cattails, and occasional mature cottonwoods, but also features stands of common ruderal and noxious weeds. Some ditch bank areas are grazed by livestock and others are sprayed with herbicide to kill weeds, willows, trees, and other vegetation growing in or around the ditches. Invasive weed species in the ditch corridor include Canada thistle and other thistles, Russian knapweed, and whitetop.

A wetland and riparian habitat evaluation was performed for the Proposed Action Area by Wildlife & Natural Resource Concepts & Solutions, LLC (Zeman 2012) to quantify potential wetland and riparian habitat values that would be lost in the project area due to project implementation. The evaluation was modeled after methodology outlined in Reclamation’s May 2012 “Basinwide Salinity Control Program: Procedures for Habitat Replacement.” Table 3 and Figure 5 show the results of the wetland and riparian habitat evaluation.

</table>
According to the evaluation method, Total Habitat Value (THV) is calculated for each affected wetland or riparian habitat area by multiplying its acreage by its habitat quality score (HQS), which is assigned based on a series of criteria. The predicted total of THV units affected due to project implementation is the sum of the THVs across the Proposed Action Area. A total of approximately 11.1 acres of wetland or riparian habitat (equating to a total wetland and riparian habitat value of 7.88 units based on Habitat Quality Scoring) were identified adjacent to or associated with the existing structures involved in the Proposed Action (Figure 5).

**Proposed Action**: implementation of the Proposed Action would result in permanent loss of wetland and riparian habitat because ditch seepage would no longer provide wetland hydrology to adjacent areas and ditch channels and banks would no longer provide a riparian-type environment. However, the quality of the wetland and riparian habitat existing due to the ditches is perceived to be relatively low overall, and the total habitat value to be lost is estimated at 7.88 units. Replacement habitat to mitigate these losses (see Section 4.6) is proposed on private property on the Adam Ranch, approximately 0.5 mile north of the Proposed Action Area. Additionally, construction of the Proposed Action and the replacement habitat would follow Best Management Practices to minimize the construction footprint, protect water quality, and minimize soil erosion. Revegetation and weed control would be implemented according to BLM right-of-way permit conditions and Delta County standards.

**No Action**: the No Action Alternative would have no effect on existing vegetation or habitat.

### 3.6 Wildlife Resources

In the Proposed Action Area, riparian areas and seep areas support wetland and riparian habitat of limited value, which are subject to disturbance from periodic maintenance. About half of all adjacent areas are irrigated farmlands, and about half are native vegetation types (see Sections 3.1 and 3.5). The habitat associated with the ditches involved in the Proposed Action Area occurs in narrow strips and small patches, while typically not supporting the numbers of breeding birds and other wildlife that larger blocks of habitat support, but nevertheless are important habitat. In addition to nesting birds, these habitats support small mammals and in association with adjacent irrigation land provide hunting areas for raptors and other wildlife.

The Colorado Parks & Wildlife (CPW) describes the entire Proposed Action Area as lying within a mule deer resident population area, critical winter range, severe winter range, and summer range, and the west half of the Proposed Action Area as lying within a mule deer concentration area (CPW 2011; Figure 6). CPW describes the entire Proposed Action Area as elk winter range.
range and elk severe winter range, and elk winter concentration areas (CPW 2011; Figure 7). The project area is also described as a winter forage area for bald eagle (CPW 2011).

**Proposed Action:** Upland wildlife habitat impacted by the Proposed Action would likely result in minor temporary impacts to wildlife species within the Project Area. Local wildlife may avoid using portions of the Project Area because of temporary disturbances due to pipeline construction. However, these impacts should be short-term in duration. Key wildlife species such as mule deer, elk, and raptors using the Proposed Action Area are also using the adjacent agricultural fields and pastures for forage, and would return to those areas when construction disturbances cease. Estimated impacts to about 11.1 acres of riparian and wetland habitats described in Section 3.5 of this document would directly impact those species dependent on these habitat types. Predicted habitat losses include emergent, shrub/scrub, and forested wetland habitats supported by irrigation seepage and the wetted ditch prisms (see Table 3). Habitat evaluations estimate that 7.88 fish and wildlife habitat units would be affected under the Proposed Action. Development of replacement habitat would mitigate impacts to wildlife and comply with requirement of the Colorado River Basin Salinity Control Act to replace fish and wildlife values foregone (see Section 4.6 for more detail). Improved water quality would likely benefit downstream aquatic species (amphibians and fish) by reducing salt and selenium loading in the North Fork, Gunnison, and Colorado rivers.

**No Action:** Under the No Action Alternative, terrestrial wildlife and habitat would remain in their current condition. Salinity loading of the Colorado River drainage would continue at current rates, which will continue to affect water quality within the drainage, potentially affecting the wildlife using the area.

### 3.7 Threatened & Endangered Species and BLM-Sensitive Species

The Endangered Species Act (ESA) of 1973 protects federally listed endangered, threatened and candidate plant and animal species and their critical habitats. Rare Earth Science conducted a threatened and endangered species inventory for the Proposed Action Area during August, September, and October 2012 (Rare Earth 2013). Table 4 summarizes the results of the inventory, itemizing the federally-listed species that may occur within Delta County, Colorado (USFWS 2013), and explaining habitat requirement information and potential effects of the Proposed Action on each species. BLM Sensitive species are discussed in the next section of this EA.

The only ESA-listed or candidate species with the potential to be affected by the Proposed Action will be four Colorado River basin endangered fishes: the bonytail, the Colorado pikeminnow, the humpback chub, and the razorback sucker. These species and the effects of the Proposed Action, which is due to water depletions in the Colorado River basin, are discussed following Table 4. Other ESA-listed species in Delta County do not occur in the Proposed Action Area, or do not depend on the habitat types in the Proposed Action Area.
Table 4. Federally-Listed Threatened, Endangered, and Candidate Species in Delta County

</tbody>
</table>

The western yellow-billed cuckoo may occur incidentally in the Proposed Action Area during foraging bouts or during migration season, but no nesting habitat for this species is within the Proposed Action Area or the immediate surroundings. The nearest known nesting habitat is approximately 5 miles from the Proposed Action Area in the cottonwood forested riparian corridor of the North Fork of the Gunnison River (Rare Earth 2013).

The upper Colorado River Basin is home to 12 native fish species, four of which are listed as endangered: bonytail, Colorado pikeminnow, humpback chub, and razorback sucker (USFWS 2012). Decline of the four endangered species is due at least in part to habitat destruction (diversion and impoundment of rivers) and competition and predation from introduced fish species. In 1994, the U.S. Fish and Wildlife Service designated critical habitat for the four endangered species at Federal Register 56(206):54957-54967, which in Colorado includes the 100-year floodplain of the upper Colorado River from Rifle to Lake Powell, and the Gunnison River from Delta to Grand Junction. None of the four endangered Colorado River fishes occur in or near Proposed Action Area and the Proposed Action Area does not occur within or adjacent to designated critical habitat. The closest designated critical habitat and the closest potential populations of the Colorado pikeminnow, and razorback sucker are in the Gunnison River, approximately 20 miles southwest of the Proposed Action Area. The bonytail has recently been stocked in the Gunnison River and humpback chubs have been recorded.
Potential impacts to Colorado River endangered fishes would result from continued water depletion in Cottonwood Creek and from Crawford Reservoir (on Iron Creek), both of which drain to the North Fork of the Gunnison River in the greater Colorado River basin. Water depletion in these basins has the potential to diminish backwater spawning areas and other habitat in downstream designated critical habitat. The estimated average historic annual amount of water diverted from the Gunnison basin tributaries due to operation of C Ditch is approximately 3,786 acre-feet for irrigation of approximately 460 acres of grass hay crops and 1,484 for winter stock water (see Section 3.2). The resulting water depletion from the Colorado River basin is estimated at 906 acre-feet per year. This estimated depletion rate is equivalent to the net annual average total crop consumptive use rate calculated using the Colorado Water Conservation Board’s “StateCU” consumptive use modeling software [CWCB 2012] with assistance from the Colorado Division of Water Resources (Division 4) Assistant Division Engineer, Jason Ullman, P.E. This depletion rate is expected to remain unchanged if the Proposed Action is implemented.

**Proposed Action:** A threatened and endangered species inventory was completed in the Proposed Action Area in 2012 (Rare Earth 2013). No threatened, endangered or candidate species were found in the Proposed Action Area. Suitable habitats for the threatened, endangered, or candidate species itemized in Table 4 (above) do not occur within the Proposed Action Area or the species’ documented ranges lie outside the Proposed Action Area. However, water depletions from the upper Gunnison River basin occurring as a result of C Ditch operations have the potential to affect downstream endangered fish habitat. No new depletions would occur as a result of the proposed action and C Ditch Company’s historic depletions were included within the 2009 Gunnison Basin Programmatic Biological Opinion (PBO) (USFWS 2009). The U.S. Fish & Wildlife Service has determined that all depletions from the Upper Colorado River Basin are considered an adverse effect to Colorado pikeminnow, razorback sucker, humpback chub and bonytail. Pursuant to the PBO, Reclamation is consulting with U.S. Fish & Wildlife Service regarding C Ditch Company’s historic depletions. The results of this consultation (a Recovery Agreement) will be included in the Final EA. In addition, the cumulative efforts of the Colorado River Basin Salinity Control Program improve water quality within designated critical habitats for the Colorado pikeminnow, razorback sucker, humpback chub, and bonytail throughout the Colorado River and Gunnison river basins by reducing salt and selenium loads. Additionally, potential reductions in selenium loading to the Gunnison basin as a result of the Proposed Action would contribute to the overall success of the Gunnison Basin Selenium Management Program (SMPW 2011).

**No Action:** In the absence of the Proposed Action, historic water depletions would continue, and salt and selenium loading from the Proposed Action Area would continue at current rates.

### 3.8 BLM Sensitive Species

The Proposed Action is located partially on BLM lands managed by BLM’s Uncompahgre Field Office (UFO). According to BLM Manual Part 6840, BLM Sensitive species (in addition to those proposed for listing under the federal ESA) are “species requiring special management consideration to promote their conservation and reduce the likelihood and need for future listing under the ESA.” BLM Sensitive species are designated by the BLM’s state director, and BLM Sensitive species found in the UFO (BLM 2011) and with documented occurrences in Delta County are listed on Table 5, below.
Rare Earth Science conducted an inventory for BLM Sensitive species in the Proposed Action Area during August, September, and October 2012 (Rare Earth 2013). While no BLM Sensitive species were observed in the Proposed Action Area during the inventory, seasonal foraging or migratory habitat exists in the Proposed Action Area or the immediate vicinity of the Proposed Action Area for certain BLM Sensitive species, and one BLM Sensitive species, the northern leopard frog, potentially uses the Proposed Action Area as breeding habitat (see Table 5).

Table 5. BLM Sensitive Species in Delta County

<tbody>
<tr>
<td>BIRDS</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>American peregrine falcon <em>Falco peregrines</em></td>
<td>Uses open country near cliff habitat, often near water. An active peregrine falcon nest site exists on Needle Rock on BLM’s Needle Rock ACEC (see Figure 1) about 2.75 miles east-by-southeast of the Project area. Species may forage for passerine birds in the Project area; however more desirable foraging habitat exists closer to the nest site in the Smith Fork River corridor.</td>
<td>Yes</td>
<td>Foraging only</td>
</tr>
<tr>
<td>American white pelican <em>Pelecanus erythrorhynchos</em></td>
<td>Inhabits large reservoirs but also observed on smaller water bodies including ponds; nests on islands. An extremely rare to uncommon migrant or seasonal resident with no documented nesting records in Delta. Nearest local migratory stopover site is Fruitgrowers Reservoir, about 17 miles northwest of the Project area.</td>
<td>Migratory only</td>
<td>No</td>
</tr>
<tr>
<td>Bald eagle <em>Haliaeetus leucocephalus</em></td>
<td>Nests along forested rivers and lakes; winters in upland areas, often with rivers or lakes nearby. No records of recent nesting in Delta County. CPW maps the project area and surrounding mesas as winter range and winter foraging range. A documented roost site lies about 2 miles southwest on private lands on Grandview Mesa. Bald eagles likely forage across open pastures in the vicinity of the Project area for rodents and carrion.</td>
<td>Yes</td>
<td>Winter foraging only</td>
</tr>
<tr>
<td>Brewer’s sparrow <em>Spizella breweri</em></td>
<td>Breeds primarily in sagebrush shrublands, and less commonly in tall desert shrublands; requires relatively large shrubland patches for nesting. Migrants occur in wooded, brushy, and weedy riparian, agricultural, and urban areas, and occasionally in pinyon-juniper woodlands. Breeding records exist for southeast Delta County; however, favored nesting habitat is not within the Project area.</td>
<td>Yes</td>
<td>Primarily migratory</td>
</tr>
<tr>
<td>Burrowing owl <em>Athene cunicularia</em></td>
<td>Prefers level to gently-sloping grasslands and semi-desert grasslands; prairie dog colonies are commonly used for shelter, nesting, and prey. Delta County breeding records are in the Uncompahgre River valley only. No extensive prairie dog colonies are present in or near the Project area which could support burrowing owls.</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>
### Environmental Assessment  
**C Ditch/Needle Rock Pipeline Project**  

**Common Name** | **Habitat Requirement Summary** | **Range in Project Area?** | **Habitat in Project Area?**  
--- | --- | --- | ---  
**Ferruginous hawk**  
* *Buteo regalis*  
Prefers open, rolling and/or rugged terrain in grasslands, shrubsteppe communities, or cultivated fields; nests on cliffs and rock outcrops. No nesting records in Delta County. Wintering birds could be present around the Project area, especially open agricultural fields where burrowing rodents are present.  
Yes | Potential winter foraging habitat only (not on BLM lands)  
**Northern goshawk**  
* *Accipiter gentilis*  
Nests in a variety of forest types, including deciduous, coniferous, and mixed forests including ponderosa pine, lodgepole pine, spruce-fir, aspen. Migrants and wintering individuals occur in all coniferous forest types, including pinyon-juniper woodlands. Disturbance to pinyon-juniper woodlands as a result of the Proposed Action would be minimal.  
Yes | Potential winter foraging habitat only  
**White-faced ibis**  
Nests and roosts in marshes and emergent wetlands associated with lakes or reservoirs, feeds in wet hay meadows and flooded croplands (in the UFO, a fairly common spring/fall migrant, non-breeding).  
Migratory only | No  

**FISHES**  

**Colorado River cutthroat trout**  
* *Oncorhynchus clarki pleuriticus*  
Cool, clear streams or lakes with well-vegetated stream banks for shading cover, along with deep pools, boulders, and logs; thrives at high elevations. Nearest population documented in the north Smith Fork of the Gunnison River, east of the Town of Crawford. No spawning habitat or consistent perennial water in the Proposed Action Area.  
Yes | No  
**Bluehead sucker**  
* *Catostomus discobolus*  
Large rivers and mountain streams, rarely in lakes; variable from cold clear mountain streams to warm, turbid streams; moderate to fast-flowing water above rubble-rock substrate; young prefer quiet shallow areas near shoreline. Although no habitat is present within the project area for this species, downstream habitat on the Gunnison and Colorado Rivers is affected by consumptive use of water from Cottonwood Creek and Crawford Reservoir.  
Yes | No, but habitat is downstream  
**Flannelmouth sucker**  
* *Catostomus latipinnis*  
Warm moderate- to large-sized rivers, seldom in small creeks, absent from impoundments; pools and deeper runs often near tributary mouths; also riffles and backwaters; young usually in shallow water than are adults. Although no habitat is present within the project area for this species, downstream habitat on the Gunnison and Colorado Rivers is affected by consumptive use of water from Cottonwood Creek and Crawford Reservoir.  
Yes | No, but habitat is downstream
<table>
<thead>
<tr>
<th>Common Name</th>
<th>Habitat Requirement Summary</th>
<th>Range in Project Area?</th>
<th>Habitat in Project Area?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roundtail chub <em>Gila robusta</em></td>
<td>Water-water rocky runs, rapids, and pools of creeks and small to large rivers; also large reservoirs in the upper Colorado River system; generally prefers cobble-rubble, sand-cobble, or sand-gravel substrate. Although no habitat is present within the project area for this species, downstream habitat on the Gunnison and Colorado Rivers is affected by consumptive use of water from Cottonwood Creek and Crawford Reservoir.</td>
<td>Yes</td>
<td>No, but habitat is down-stream</td>
</tr>
<tr>
<td><strong>MAMMALS</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Big free-tailed bat <em>Nyctinomops macrotis</em></td>
<td>Colorado’s largest bat. Forages mostly on large moths. Roosts in crevices on cliff faces, or in buildings. No breeding records exist for Colorado; wandering individuals are expected across most of the state. Some loss of foraging habitat will occur as a result of the Proposed Action.</td>
<td>Yes</td>
<td>Foraging only</td>
</tr>
<tr>
<td>Desert bighorn sheep <em>Ovis canadensis nelsoni</em></td>
<td>Steep, mountainous or hilly terrain with grass, low shrubs, rock cover, and areas near open escape and cliff retreats. In Delta County, range (as mapped by CPW) is limited to the Gunnison Gorge area, more than 5 miles west of the Project area.</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Fringed myotis <em>Myotis thysanodes</em></td>
<td>Feeds in semi-desert shrublands, coniferous woodlands, and oakbrush; associated with caves, mines, and buildings as day and night roosts. No nursery colonies have been reported in Colorado. Individuals may forage in the area during summer months, especially near water. Some loss of foraging habitat will occur as a result of the Proposed Action.</td>
<td>Yes</td>
<td>Foraging only</td>
</tr>
<tr>
<td>Kit fox <em>Vulpes macrotis</em></td>
<td>Semi-desert shrublands, sagebrush shrublands, and shrubby margins of pinyon-juniper woodlands. Denning tends to occur in bottoms of steep-walled washes, and occasionally among rock outcrops and below rimrock. Current range in Colorado is limited to the Gunnison and Colorado River drainages below about 6,000 feet. Historic range apparently never extended into eastern Delta County. Nearest recently documented population (prior to the year 2000) in Delta County was in Peach Valley near the City of Delta.</td>
<td>No</td>
<td>N/A</td>
</tr>
<tr>
<td>Spotted bat <em>Euderma maculatum</em></td>
<td>In Colorado, spotted bats have been observed or captured in ponderosa pine woodlands, montane forests, pinyon-juniper woodlands, semi-desert shrublands, riparian vegetation, and open sandbars. Individuals forage alone for moths, grasshoppers, beetles, katydids, and other insects. Lactating females have been captured in Colorado, but nursery sites have not been located. Some loss of foraging habitat will occur as a result of the Proposed Action.</td>
<td>Yes</td>
<td>Foraging only</td>

**Proposed Action:** Implementation of the Proposed Action will result in temporal disturbance (construction activities) in the vicinity of raptor winter foraging areas, namely the open irrigated agricultural fields adjacent to and near the Proposed Action Area. The affected wintering raptors are bald eagle, goshawk, and ferruginous hawk. These raptors are wide-ranging, opportunistic, and flexible in their foraging patterns and are expected to avoid the Proposed Action Area during construction. Temporal disturbance (construction activities) may disrupt early breeding season peregrine falcon foraging in the immediate vicinity; however, these birds are wide-ranging, opportunistic, and spatially flexible in their foraging patterns and can be expected to avoid the Proposed Action Area during construction. Brewer’s sparrow may find nesting habitat near the Proposed Action Area, although habitat types in and around the Proposed Action Area are not the preferred nesting habitat of Brewer’s sparrow. Migrating individuals may be present during fall and early spring months, and can be expected to avoid the Proposed Action Area during construction activities. BLM Sensitive mammals with the potential to use the Proposed Action Area include fringed myotis (a bat), Townsend’s big-eared bat, big free-tailed bat, spotted bat, and white-tailed prairie dog. The bats are expected to forage in the Proposed Action Area during summer months, and therefore will not be affected by construction activities. Relatively little upland shrubs or woodlands serving as foraging habitat for bats will be lost as a result of the Proposed Action. White-tailed prairie dogs are not established in the immediate Proposed Action Area corridor, although a few burrows may be present in the fringes of adjacent or nearby irrigated pastures. Pasture habitats with the potential to support white-tailed prairie dogs will not be affected.
be affected by the Proposed Action. It is expected that BLM Sensitive snakes potentially using the Proposed Action Area (milk snake and midget faded rattlesnake) will be hibernating outside the Proposed Action Area during project construction. Hibernating northern leopard frogs may be expected to be present during construction of the Proposed Action, and implementation of the Proposed Action will result in the loss of northern leopard frog breeding habitat. To the extent that the loss of riparian or wetland habitat will affect foraging opportunities for BLM Sensitive snakes or bats, or breeding and overwintering habitat for the northern leopard frog, these habitat losses will be mitigated by creation of a Habitat Replacement Area near the Proposed Action Area (see Section 4.6).

No BLM Sensitive fishes are expected to occur in the Proposed Action Area. However, water depletions from the upper Gunnison River basin occurring as a result of C Ditch operations have the potential to affect downstream BLM Sensitive fish habitat. No new depletions would occur as a result of the proposed action. The reduction of salinity and selenium that is expected to occur downstream in the watershed due to Proposed Action may provide some benefit for BLM Sensitive fish habitat in downstream waters (similar to the benefits provided to the downstream endangered fish habitat described in Section 3.7).

No Action: the No Action Alternative would have no effect on BLM Sensitive species or their habitats.

3.9 Cultural Resources

In September 2012, Alpine Archaeological Consultants, Inc. conducted a Class III cultural resource inventory of irrigation features and areas slated for disturbance (Horn & Hoose 2012). A total of approximately 35 acres was inventoried. The inventory resulted in the recordation of C Ditch (approximately 2.45 miles) from its origin on Cottonwood Creek westward to its terminus at the crossing of Crawford Road, and the documentation of 10 associated water control features. No additional historic or prehistoric sites were found during the inventory, with the exception of a portion of Aspen Canal, which had been documented during a different survey. C Ditch itself is officially eligible for listing in the National Register of Historic Places.

Proposed Action: In consultation with the Colorado State Historic Preservation Officer (Colorado SHPO), Reclamation determined that the Proposed Action would have an adverse effect on the C Ditch. A Memorandum of Agreement will be developed between Reclamation and the Colorado SHPO to mitigate the adverse effects of the proposed action. BLM and C Ditch Company are anticipated to participate as consulting parties. A copy of the MOA will be included in Attachment E of the Final EA. Horn & Hoose (2012) recommended that to mitigate replacement of C Ditch with a pipeline, photographic documentation be conducted to capture the historic landscape characteristics of the ditch prior to its destruction.

No Action: the No Action Alternative would have no effect on cultural or historic resources.

3.10 Agricultural Resources & Soils

The U.S. Department of Agriculture’s Natural Resources Conservation Service (NRCS) identifies farmlands of national and statewide importance in the region, based on soil types and
irrigation status. It is the policy of NRCS to “maintain and keep current an inventory of the prime farmland and unique farmland of the Nation... The objective of the inventory is to identify the extent and location of important rural lands needed to produce food, feed, fiber, forage, and oilseed crops” (7 CFR 657.2). The Proposed Action crosses two types of USDA-designated important farmland: Prime Farmland if Irrigated, and Farmland of Statewide Importance (Figure 8). Approximately 1,300 lineal feet of the project area cross or lie adjacent to Prime Farmland if Irrigated (Agua Fria clay loam, 1 to 6 percent slopes – Map Unit 5) and approximately 1,500 lineal feet cross Farmland of Statewide Importance (Limon silty clay loam, 3 to 6 percent slopes – Map Unit 51). Some of the designated important farmland areas crossed by the Proposed Project are irrigated by (and will continue to be irrigated by) the C Ditch System. NRCS defines prime farmlands as follows:

Prime farmland has the best combination of physical and chemical characteristics for producing food, feed, forage fiber and oilseed crops. Unique farmland is land other than prime farmland that is used for the production of specific high-value food and crops, such as citrus, tree nuts, olives, cranberries, and other fruits and vegetables. It has a special combination of soil quality, location, growing season, and moisture supply required to produce sustained high quality crops when properly managed. In addition, farmlands of statewide importance are lands that nearly meet the requirements for prime farmland and have been identified by state agencies.

Other mapped soil units found in the immediate Proposed Action Area (Figure 8) are Chipeta silty clay, 3 to 30 percent slopes (Map Unit 23), Killpack silty clay loam, 3 to 12 percent slopes (Map Unit 48), and Midway-Gaynor silty clay loams, 10 to 40 percent slopes (Map Unit 56). All of these soil types are derived from Mancos Shale, which formed in a marine environment and now contributes salinity loading in the Colorado River basin.

Proposed Action: under the Proposed Action Alternative, temporary disturbance to agriculturally important lands and soils will occur during construction. C Ditch Company would coordinate construction activities with adjacent landowners to minimize disturbance, and these lands will be returned to production immediately following construction and restoration of the ground surface. No farmlands will be permanently removed from production as a result of the Proposed Action. The Proposed Action would give C Ditch Company the ability to better manage its water rights with efficiencies gained from piping the system. Efficiencies gained may result in a longer irrigation season, and potentially in increased agricultural productivity. Therefore, no direct adverse effects on agriculturally significant lands are expected to occur due to implementation of the Proposed Action. Water contact with Mancos Shale derived soils would be minimized in the irrigation system as a result of the Proposed Action, which would help reduce salinity loading in the Colorado River basin.

No Action: the No Action Alternative would have no effect on prime or unique farmlands. Farmlands in the project area would continue to produce as in the past. Salinity loading from irrigation water contact with Mancos Shale-derived soils in the current irrigation ditch system would continue as it has in the past.

3.11 Recreation Resources

A single-track trail exists on BLM lands immediately south of a water crossing in the east part of the Project Area, and user-proliferated trails with motorized use exist on BLM lands in the west part of the Proposed Action Area (Figures 2 and 3). The Proposed Action is located in Colorado
Parks & Wildlife Game Management Unit (GMU) 53, and licensed big game hunters hunt on BLM lands encompassing the Project Area during hunting seasons.

**Proposed Action:** Construction of the Proposed Action would take place between October and April. Under the Proposed Action Alternative, access to the single-track trail from the water crossing over C Ditch and access to motorized trails from Davis Road will be temporarily disrupted during construction of the Proposed Action. The Proposed Action could disrupt recreational big game hunting during fall months (quality of experience and hunting success) on BLM lands south of the Project Area, due to construction activity. The Proposed Action would not result in permanent displacement of big game in the Proposed Action Area. Trail access for hunting, hiking, and motorized travel is available to the BLM lands crossed by the Proposed Action from several other points near or on public roads, namely, the Youngs Peak trail in the Town of Crawford. Pipeline trenches left open overnight would be kept to a minimum to reduce potential for hazards to the public and to wildlife. On BLM land, construction holes or pipeline trenches left open overnight will be covered. Covers will be secured in place and strong enough to prevent livestock or wildlife from falling through.

**No Action:** the No Action Alternative would have no effect on recreational resources on BLM lands. Recreation in the Project Area would continue as in the past.

### 3.12 Livestock Grazing

Cattle and sheep grazing allotments exist on BLM lands within the Project Area. Sheep grazing takes place on BLM lands traversed by about 830 lineal feet of the Project Area for one week between the dates of December 1 to February 10 (in the west part of the Project Area). Cattle grazing is permitted on BLM lands traversed by about 3,090 lineal feet of the Project Area from May 15 through June 1 (in the east part of the Project Area).

**Proposed Action:** Construction would take place between October and April. Under the Proposed Action Alternative, temporary disturbance to lands within BLM grazing allotments will occur during construction. Also, the Proposed Action will remove a source of livestock water from the grazing allotments; however, Cottonwood Creek would still be available as a source of livestock water. Lands affected by construction would be revegetated with a BLM-recommended seed mix containing grasses and forbs palatable for forage. No lands currently capable of being grazed will be rendered permanently incapable of being grazed as result of the Proposed Action. The Proposed Action may result in a small increase in lands capable of providing livestock grazing within the Project Area. Therefore, no direct adverse effects on livestock grazing allotments are expected to occur due to implementation of the Proposed Action. The timing of grazing on the cattle allotment will most likely not coincide with construction of the Proposed Action. The timing of grazing on the sheep allotment may coincide with construction of the Proposed Action in the west part of the Project Area. Grazing access to the allotment will not be affected by the Proposed Action. Pipeline trenches left open overnight would be kept to a minimum to reduce potential entrainment of livestock. Notification to the grazing permit holder(s) will be made if construction is to occur during a grazing period. C Ditch Company and its contractors will cooperate and coordinate with BLM and the grazing permit holder(s) to avoid conflicts with grazing operations.

**No Action:** the No Action Alternative would have no effect on grazing allotments on BLM lands. Livestock grazing in the Proposed Action Area would continue as in the past.
3.13 Visual Resources

A total of approximately 3,920 lineal feet of the Proposed Action Area lies on BLM lands, and part of the Proposed Action Area will be accessed via approximately 920 lineal feet of an existing BLM road (see Project Plan sheet; attached to BLM copy of the EA only). The BLM Manual 8410-1 (Visual Resource Management) defines and categorizes visual resource management classes that provide objectives for visual resources on BLM lands as projects are proposed and implemented in the landscape. These Visual Resource Management (VRM) classes are determined through an inventory process described in BLM Manual 8410-1, and are used to provide guidance to BLM and project proponents when contemplating proposed surface disturbing activities. Class I areas are protected from visible change, Class II areas allow for visible changes that do not attract attention, Class III areas allow for visible changes that attract attention but are not dominant, and Class IV areas allow for visible changes that can dominate the landscape. BLM manages the proposed project area as a Class III area.

Proposed Action: There will be short-term temporary effect to visual resources on BLM land during construction of the Proposed Action (i.e., presence of equipment, materials, and spoil piles). The visual effects of construction on BLM lands are proposed to take place at some point during the time period of October 1, 2013 through April 15, 2014. Following construction, the Proposed Action Area will be graded and vegetated to match the surrounding landscape as much as possible. In the east part of the Proposed Action Area, it will be necessary to scale back hillslopes above (south of) certain parts of the Project Alignment in order to create a safe work platform for construction. Scaled slopes will be similar in appearance to the original slopes, which are currently mostly unvegetated Mancos shale-derived soils. Scaled soil and rock will be used onsite for construction purposes, or hauled outside the Proposed Action Area and used for adjoining private property improvements. Overall, the level of change to the visual characteristics of the landscape in and around the Proposed Action Area during and following construction will be low to moderate, and not out of character with the surrounding landforms, or with the rural-agricultural character of the vicinity.

No Action: the No Action Alternative would have no effect on visual resources on BLM lands in the Proposed Action Area.

3.14 Cumulative Impacts

Cumulative impacts are impacts on the environment, which result from the incremental impact of the action, when added to other past, present, and reasonably foreseeable future actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

At this time, there are no known federal, state, or local projects occurring within the Proposed Action Area or immediate vicinity, with the exception of the Gunnison Basin Selenium Management Program (SMPW 2011), which identifies the vicinity of the Proposed Action Area as a potential contributor to selenium in the basin. Implementation of the Proposed Action will help further the following goals of the Gunnison Basin Selenium Management Program (SMPW 2011): to maintain or improve the existing downward trend in lower Gunnison River selenium concentrations, and to sufficiently improve water quality conditions to assist in the recovery of the endangered Colorado pikeminnow and razorback sucker by reducing selenium concentrations in the lower Gunnison basin. Locally, the Proposed Action Area and duration of disturbance under the Proposed Action are small and short-term, and long term impacts are not
expected to raise cumulative negative impacts to a significant level. The Proposed Action will comply with all relevant federal, state and local permits (detailed in the Summary and Environmental Commitments Section of this document).

There are three federal programs (including the Gunnison Basin Selenium Management Program) that include the project area at a basin-wide scale. When the Proposed Action is analyzed with components of these basin-wide programs, the cumulative beneficial effects on water quality are significant. The first program is the Colorado River Basin Salinity Control Program, which provided the funding for implementation of the proposed action. Collectively, projects funded under the Program, result in improved water quality with the goal of reducing salt loading in the Colorado River. The second is the Upper Colorado River Endangered Fish Recovery Program. The Recovery Program involves federal, state and private organizations and agencies in Colorado, Utah, and Wyoming. Partners of the Recovery Program are recovering four species of endangered fish in the Colorado River and its tributaries while water use and development continues to meet human needs in compliance with interstate compacts and applicable federal and state laws. The third program is the development and implementation of the Gunnison Basin Selenium Management Program which is required as a conservation measure by the Gunnison Basin Programmatic Biological Opinion (USFWS 2009). Reclamation is working with entities in the Gunnison Basin to develop the Gunnison Basin Selenium Management Plan to reduce selenium levels in the Gunnison River at Whitewater.

### 3.15 Summary of Impacts

Table 6 lists predicted impacts of the No Action and Proposed Action Alternatives analyzed in this EA.

<table>
<thead>
<tr>
<th>Resource Issue</th>
<th>No Action Alternative</th>
<th>Proposed Action Alternative</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water Rights and Use</td>
<td>No Effect</td>
<td>No Effect</td>
</tr>
<tr>
<td>Water Quality</td>
<td>Salt and selenium loading from the project area would continue to affect water quality in the Colorado River Basin</td>
<td>An estimated salt loading reduction of 1,283 tons per year to the Colorado River Basin will result from implementation of the Proposed Action. The proposed action is also expected to reduce selenium loading into the Gunnison River; however, these benefits have not been quantified. Improved water quality would likely benefit downstream aquatic species by reducing salt and selenium loading in the North Fork, Gunnison, and Colorado rivers.</td>
</tr>
<tr>
<td>Access &amp; Temporary Disturbance</td>
<td>No Effect</td>
<td>Short-term temporary adverse effects consisting of noise, ground, and vegetation disturbance to property owners in the Proposed Action Area. A permanent cut in a rock slope on BLM lands in the east part of the Proposed Action Area would result from construction. Spoils from the cut slope will be used for project construction, and any excess will be hauled to adjoining private property for use as clean fill material.</td>
</tr>

<tr>
<td>------------------------</td>
<td>-----------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Recreation Resources</td>
<td>No Effect</td>
<td>Access to a BLM foot trail in the east part of the Project Area will be disrupted temporarily during construction. The Proposed Action is tentatively scheduled to begin in October 2013, and could disrupt recreational big game hunting (quality of experience and hunting success) on BLM lands to the south (due to construction noise and temporarily disrupted access to the BLM foot trail in the east part of the Project Area). Trail access for hunting, hiking, and motorized travel is available to the BLM lands crossed by the project area from several other points near or on public roads, namely, the Youngs Peak trail in the Town of Crawford.</td>
</tr>
<tr>
<td>Livestock Grazing</td>
<td>No Effect</td>
<td>Temporary effect. No lands capable of providing grazing will be permanently lost. The Proposed Action is proposed to take place on BLM land outside the cattle allotment grazing timeframe. Sheep grazing may possibly coincide with one week during construction of the proposed action; however, construction activities will not impede access to the grazing allotment and project personnel will coordinate with the grazing permit holder(s) to avoid conflicts with grazing operations. A livestock water source will be lost on the allotments due to the Proposed Action, but alternate water resources are available.</td>
</tr>
<tr>
<td>Visual Resources</td>
<td>No Effect</td>
<td>Short-term temporary effect during construction (i.e., presence of equipment, spoil piles), with revegetation commencing following completion of the project. A permanent cut in a rock slope on BLM lands in the east part of the Proposed Action Area would result from construction. Spoils from the cut slope will be used for project construction, and any excess will be hauled to adjoining private property for use as clean fill material. The cut slope will be similar in appearance and character to its appearance and character prior to construction.</td>
</tr>
</tbody>
</table>

The Proposed Action will result in no change or have no effect on Indian trust assets, environmental justice, recreation resources, agricultural resources (prime & unique farmlands), or livestock grazing. Water rights and uses, water quality and endangered species would all benefit from the proposed action. Negative impacts to vegetation, fish and wildlife, cultural, recreational, and visual resources would not be significant with implementation of the mitigation measures described in Section 4, the Environmental Commitments and Mitigation Section of this document.
4 ENVIRONMENTAL COMMITMENTS & MITIGATION MEASURES

This section discusses the environmental commitments and related mitigation developed to protect resources and mitigate adverse impacts to a non-significant level. The cooperative agreement between Reclamation and C Ditch Company requires that Company be responsible for “…implementing and/or complying with the environmental commitments contained in the NEPA/Endangered Species Act compliance documents to be developed by Reclamation for the project”.

The following environmental commitments will be implemented as an integral part of the Proposed Action.

4.1 Construction Access

All construction activities would be confined to rights-of-way negotiated between C Ditch Company and the landowners. Construction staging (for pipe and equipment) will take place in several areas, as shown on the Project Plan drawings in on Figures 2 and 3 of this report. Environmental commitments will be included in BLM right-of-way authorizations and agreements with private landowners. Any construction activities outside of the inventoried Proposed Action Area would require additional review by Reclamation to determine if the existing surveys and information are adequate to evaluate additional impacts outside this corridor. Additional NEPA or Endangered Species Act compliance activities may be required if determined by Reclamation.

4.2 Water Quality

The following Best Management Practices (BMPs) and environmental commitments would be implemented to minimize erosion and protect water quality of downstream resources:

- The contractor would obtain a CWA Section 402 Storm Water Discharge Permit (NPDES) from the Colorado Department of Public Health and Environment for dewatering the construction area if dewatering is needed. (Dewatering will not be necessary, as construction will take place when water conveyances are empty.)

- Silt curtains, cofferdams, dikes, straw bales, or other suitable erosion control measures will be used to prevent erosion from entering water bodies during construction.

- Concrete pours will occur in forms and/or behind cofferdams to prevent discharge into waterways. Any wastewater from concrete-batching, vehicle wash down, and aggregate processing will be contained and treated or removed for off-site disposal.

- Fuels, lubricants, hydraulic fluids, and other petrochemicals will be stored and dispensed in an approved staging area. Equipment will be inspected daily for petrochemical leaks. Construction equipment will be parked, stored, and serviced only at an approved staging area.

- A spill response plan will be prepared for area of work where spilled contaminants could flow into water bodies. All employee and workers, including those under separate contract, will be briefed and made familiar with this plan. The plan will be developed prior to initiation of construction. A spill response kit, which includes appropriate-sized spill blankets, shall be easily accessible and onsite at all times.
• Onsite supervisors and equipment operators will be trained and knowledgeable in the use of spill containment equipment.

• Appropriate federal and Colorado authorities (including BLM) will be immediately notified in the event of any contaminant spill.

• Because the Proposed Action is exempted, no Section 401 Water Quality Certification is required; however, BMPs would be implemented to protect water resources.

4.3 Irrigation Facilities & Structures

Pursuant to the Cooperative Agreement between C Ditch Company and Reclamation, C Ditch Company will permanently dewater, remove from irrigation service, and render incapable of irrigation water delivery those open ditches abandoned as part of the Proposed Action. C Ditch Company will be responsible for removing all irrigation structures (head gates, drops, etc.) and refilling the abandoned ditch prism with soil.

4.4 Ground Disturbances

Ground disturbances would be limited to only those necessary to safely implement the Proposed Action. Best Management Practices to reduce disturbances to vegetation resources reduces the amount of planting or reseeding needed. Planting and reseeding disturbed areas, per landowner specifications; monitoring plantings to ensure establishment, control noxious weeds in disturbed areas, and the use of accepted erosion control measures during construction are all incorporated as environmental commitments for the Proposed Action.

During construction, topsoil would be saved and then redistributed after completion of construction activities. All disturbed areas would be smoothed, shaped, contoured and reseeded to as near their pre-project conditions as practicable. Seeding would occur at appropriate times with weed-free seed mixes per landowner specifications and the BLM right-of-way permit condition. Weed control will be implemented in accordance with BLM right-of-way permit conditions and current Delta County weed control standards.

4.5 Fish & Wildlife Resources

Construction areas would be confined to the smallest feasible area to limit disturbance to wildlife within the Proposed Action Area. Pipeline trenches left open overnight would be kept to a minimum to reduce potential entrainment of small animals and public safety problems.

4.6 Habitat Replacement

Habitat development and/or enhancement to replace the predicted 7.88 fish and wildlife habitat units affected under the Proposed Action are required under the Colorado River Salinity Control Act. C Ditch Company is responsible for developing and implementing a Reclamation-approved wildlife habitat replacement plan to replace fish and wildlife values foregone as a result of project implementation.

Habitat replacement will be implemented concurrently with implementation of the Proposed Action. C Ditch Company and Reclamation staff is currently working with Wildlife and Natural Resource Concepts & Solutions, LLC and Reclamation to develop a proposed Habitat Replacement Plan, which will be implemented on the nearby Adam Ranch and create enough
habitat value units to replace the 7.88 total habitat value units affected due to project implementation. The proposed Habitat Replacement Site location is shown on Figures 2, 3, and 4.

The Habitat Replacement Plan involves rebuilding and enlarging a series of small dams to create three enlarged wetlands on an existing irrigation ditch which is fed by a spring. Each enlarged wetland will be about 0.75 acre in size, 3 to 6 feet in depth, and irregular in shape. Willows, alders, and cottonwoods will be planted in the margins around the wetlands, and native upland and mesic shrubs will be planted in a habitat shelterbelt on the north side of the site. Shrubs will include species such as three-leaf sumac, wild rose, chokecherry, native plum, and silver buffaloberry. The site will be fenced with 8-foot-tall big game fencing to exclude deer, elk, and cattle while the plantings are establishing, and following satisfactory establishment of plantings, livestock fencing will be installed to exclude cattle. Water control structures will be installed to help regulate water levels in the wetlands, and to provide water to stock tanks outside the Habitat Replacement Area. A weed treatment program will be implemented to meet standards set by Delta County and the State of Colorado. The Habitat Replacement Plan and any associated agreements must be finalized and approved by Reclamation prior to any construction activities.

The wetlands will be created by digging irregular shaped potholes and utilizing three existing dams on the irrigation ditch in the Habitat Replacement Area. The material excavated from the potholes will be used offsite to level nearby agricultural fields. By disposing excavated materials off site and using existing dams, no wetlands permit from the Corps of Engineers will be required.

The Habitat Replacement Area will provide habitat for a diversity of local wildlife, including big game, songbirds, raptors, a variety of small mammals, reptiles, and amphibians, including the BLM Sensitive northern leopard frog.

C Ditch Company will be responsible for maintaining the Habitat Replacement area. Failure to develop and implement concurrent habitat replacement may result in delays in obligating funding under the Cooperative Agreement.

4.7 Federally-Listed Species

C Ditch Company will enter into a recovery agreement with the U.S. Fish & Wildlife Service to incorporate its historic depletions under the umbrella of the Gunnison Basin Biological Opinion. A copy of the recovery agreement will be included in Attachment D of the Final EA. In the event that threatened or endangered species (see Table 4) are encountered during construction, C Ditch Company shall stop construction activities until Reclamation has completed consultation with the U.S. Fish & Wildlife Service to ensure that adequate measures are in place to avoid or reduce impacts to the species.

4.8 Cultural Resources

Reclamation and the Colorado State Historic Preservation Office (SHPO) will enter into a Memorandum of Agreement (MOA) to mitigate the Proposed Action’s adverse effects to cultural resources. The MOA will likely commit Reclamation to complete historic resource documentation of the exiting ditch and structures prior to construction activities in accordance with the guidance for Level 1 documentation found in “Historic Resource Documentation, Standards for Level I, II and III Documentation” (COAHP 2007). C Ditch Company and BLM
would likely participate and sign as consulting parties in the MOA. In the event that cultural and/or paleontological resources are discovered during construction, C Ditch Company shall stop construction activities until Reclamation has completed consultation with the SHPO and appropriate measures are implemented to protect or mitigate the discovered resource.

4.9 Agricultural Resources & Soils

During construction, topsoil would be saved and then redistributed after completion of construction activities. Silt curtains, cofferdams, dikes, straw bales, or other suitable erosion control measures will be used to minimize soil erosion and prevent soil erosion from entering water bodies during construction. All disturbed areas would be smoothed, shaped, contoured and reseeded to as near their pre-project conditions as practicable. Lands previously in agricultural production will be returned to agricultural production following construction.

4.10 Recreation Resources

During construction, trail access for hunting, hiking, and motorized travel is available to the BLM lands crossed by the Proposed Action from several other points near or on public roads, namely, the Youngs Peak trail in the Town of Crawford. Pipeline trenches left open overnight would be kept to a minimum to reduce potential for hazards to the public and to wildlife. On BLM land, construction holes or pipeline trenches left open overnight will be covered. Covers will be secured in place and strong enough to prevent livestock or wildlife from falling through.

4.11 Livestock Grazing

The timing of grazing on the BLM cattle allotment (east end of the Proposed Action Area) will not likely coincide with construction of the Proposed Action. The timing of grazing on the BLM sheep allotment (west end of the Proposed Action Area) may coincide with construction of the Proposed Action. Notification to the grazing permit holder(s) will be made if construction is to occur during a grazing period. Pipeline trenches left overnight would be kept to a minimum to reduce potential entrainment of livestock. Construction holes or pipeline trenches left open overnight will be covered. Covers will be secured in place and strong enough to prevent livestock or wildlife from falling through. Project personnel will cooperate with the grazing permit holder(s) to avoid conflicts with grazing operations. Access to the grazing allotments will not be affected by the Proposed Action. Temporarily disturbed BLM lands will be revegetated with a BLM-recommended seed mix containing grasses and forbs palatable for forage.

4.12 Visual Resources

Following construction, the Proposed Action Area will be graded and vegetated to match the surrounding landscape as much as possible. Scaled slopes will be similar in appearance to the original slopes, which are currently mostly unvegetated Mancos shale-derived soils. Overall, the level of change to the visual characteristics of the landscape in and around the Proposed Action Area during and following construction will be low to moderate, and not out of character with the surrounding landforms, or with the rural-agricultural character of the vicinity.

4.13 Hazardous Materials, Waste Management & Pollution Prevention

Environmental impacts from hazardous materials or waste related to the Proposed Action involve potential spills or leaks of motor fuels and lubricants. Fuel and lubricant spills have the potential to impact soil and water resources, but because of the relatively small amounts of such
materials that would be used in the Proposed Action Area (i.e., a 55-gallon drum), impacts from accidental spills or leaks are expected to be minimal.

During construction, the use, storage and disposal of hazardous materials and wastes within the Proposed Action Area will be managed in accordance with all federal, state, and local standards, including the Toxic Substances Control Act of 1976, as amended (15 U.S.C. 2601, et seq., 40 CFR Part 702-799, and 40 CFR 761.1-761.193). Any trash or solid wastes generated during the Proposed Action will be properly disposed offsite.

The following Best Management Practices (BMPs) and environmental commitments would be implemented with regard to hazardous materials, waste management, and pollution prevention:

- The construction contractor shall transport, handle, and store any fuels, lubricants, or other hazardous substances involved with the Proposed Action in an appropriate manner that prevents them from contaminating soil and water resources.

- Portable secondary containment shall be provided for any fuel or lubricant containers staged on BLM land within the Proposed Action Area. Any staging of fuel or lubricants, or fueling or maintenance of vehicles or equipment, will not be conducted within 100 feet of any live water or drainage.

- A spill response plan will be prepared for area of work where spilled contaminants could flow into water bodies. All employee and workers, including those under separate contract, will be briefed and made familiar with this plan. The plan will be developed prior to initiation of construction.

- A spill response kit, which includes appropriate-sized spill blankets, shall be easily accessible and onsite at all times.

- Onsite supervisors and equipment operators will be trained and knowledgeable in the use of spill containment equipment.

- All spills, regardless of size, shall be cleaned up promptly and contaminated soil shall be disposed of at an approved facility.

- Appropriate federal and Colorado authorities will be immediately notified in the event of any contaminant spill. Any spills on BLM lands will be reported to BLM promptly. Any release of toxic substances (leaks, spills, etc.) in excess of the reportable quantity established by 40 CFR, Part 117 shall be reported as required by the Comprehensive Environmental Response, Compensation and Liability Act of 1980, section 102b. A copy of any report required or requested by any federal agency of state government as a result of a reportable release or spill of any toxic substances shall be furnished to BLM concurrent with the filing of the reports to the involved Federal agency or State government.

Exemptions from Section 404 of the Clean Water Act
Irrigation Exemption Summary

FARM OR STOCK POND OR IRRIGATION DITCH CONSTRUCTION OR MAINTENANCE

Pursuant to Section 404 of the Clean Water Act (33 USC 1344) and Federal Regulations (33 CFR 324.4(a)(3)), certain discharges for the construction or maintenance of farm or stock ponds or irrigation ditches have been exempted from requiring a Section 404 permit. Included in the exemption are the construction or maintenance of farm or stock ponds or irrigation ditches, or the maintenance (but not the construction) of drainage ditches. Discharges associated with siphons, pumps, headgates, wingwalls, weirs, diversion structures, and such other facilities as are appurtenant and functionally related to irrigation ditches are included in this exemption.

A Section 404 permit is required if either of the following occurs:

1. Any discharge of dredged or fill material resulting from the above activities which contains any toxic pollutant listed under Section 307 of the Clean Water Act shall be subject to any applicable toxic effluent standard or prohibition, and shall require a permit.

2. Any discharge of dredged or fill material into waters of the United States incidental to the above activities must have a permit if it is part of an activity whose purpose is to convert an area of the waters of the United States into a use to which it was not previously subject, where the flow or circulation of waters of the United States may be impaired or the reach of such waters reduced. Where the proposed discharge will result in significant discernible alterations to flow or circulation, the presumption is that flow or circulation may be impaired by such alteration. For example, a permit will be required for the conversion of a wetland from silvicultural to agricultural use where there is a discharge of dredged or fill material into waters of the United States in conjunction with construction of dikes, drainage ditches, or other works or structures used to effect such conversion. A discharge which elevates the bottom of waters of the United States without converting it to dry land does not thereby reduce the reach of, but may alter the flow or circulation of, waters of the United States.

If the proposed discharge satisfies all of the above restrictions, it is automatically exempted and no further permit action from the Corps of Engineers is required. If any of the restrictions of this exemption will not be complied with, a permit is required and should be requested using ENG Form 4345 (Application for a Department of the Army permit). A nationwide permit authorized by the Clean Water Act may be available for the proposed work. State or local approval of the work may also be required.

For general information on the Corps' Regulatory Program please check our website at www.sreb.army.mil/regulatory. For additional information or for a written determination regarding a specific project, please contact the Corps at the following addresses:

Maintenance Exemption Summary

US Army Corps of Engineers
Sacramento District
1325 J Street
Sacramento, CA 95814-2922

Maintenance (Including Emergency Reconstruction)

Pursuant to Section 404 of the Clean Water Act (33 USC 1344) and Federal Regulations (33 CFR 323.4(a)(2)), certain discharges for the maintenance, including emergency reconstruction of recently damaged parts, of currently serviceable structures such as dikes, dams, levees, groins, riprap, breakwaters, causeways, bridge abutments or approaches, and transportation structures, have been exempted from requiring a Section 404 permit. Maintenance does not include any modification that changes the character, scope, or size of the original fill design. Emergency reconstruction must occur within a reasonable period of time after damage occurs in order to qualify for this exemption.

A Section 404 permit is required if either of the following occurs:

1. Any discharge of dredged or fill material resulting from the above activities which contains any toxic pollutant listed under Section 307 of the Clean Water Act shall be subject to any applicable toxic effluent standard or prohibition, and shall require a permit.

2. Any discharge of dredged or fill material into waters of the United States incidental to the above activities must have a permit if it is part of an activity whose purpose is to convert an area of the waters of the United States into a use to which it was not previously subject, where the flow or circulation of waters of the United States may be impaired or the reach of such waters reduced. Where the proposed discharge will result in significant discernible alterations to flow or circulation, the presumption is that flow or circulation may be impaired by such alteration. For example, a permit will be required for the conversion of a wetland from silvicultural to agricultural use when there is a discharge of dredged or fill material into waters of the United States in conjunction with construction of dikes, drainage ditches, or other works or structures used to effect such conversion. A conversion of a Section 404 wetland to a non-wetland is a change of use of an area of waters of the United States. A discharge which elevates the bottom of waters of the United States without converting it to dry land does not thereby reduce the reach of, but may alter the flow or circulation of, waters of the United States.

If the proposed discharge satisfies all of the above restrictions, it is automatically exempted and no further permit action from the Corps of Engineers is required. If any of the restrictions of this exemption will not be complied with, a permit is required and should be requested using ENG Form 4345 (Application for a Department of the Army permit). A nationwide permit authorized by the Clean Water Act may be available for the proposed work. State or local approval of the work may also be required.

State of Colorado

Structure Summary Report

Structure Name: ASPEN CANAL
Source: IRON CREEK

Location: Q10 040 010 Section 12 Township 50 Range PM
Distance From Section Lines: From NS Line: 411 N From EW Line: 113 Y
UTM Coordinates (H/min): Northing (UTM y): 2173271 Easting (UTM x): 113 Y

Water Rights Summary:
- Total Decreed Rate(s) (CFPS): Absolute: 150.0000
- Total Decreed Volume(s) (AF): Absolute: 0.0000

### Maximum

- 3

### Minimum

- 0

### Average

- 0

**Notes:**

- The average considers all years with diversion records, even if no water is diverted.
- The above summary lists total monthly diversions.
- *A* indicates Inferred December. All other values are derived from daily records.
- Average values include infrequent data if infrequent data are the only data for the year.
