COMPARISON OF BHBF, HMF AND SEDIMENT CONSERVATION FLOWS			
PURPOSE	Reform backwatersMaintain sandbars (important for camping beaches and fish habitat)	Deposit sediment at high elevationsRe-form backwater channelsDeposit nutrientsRestore some of the natural system dynamics along the river corridorHelp the National Park Service manage riparian habitats	—Deposit sediment at high elevations
MAXIMUM RELEASE	-Within PP capacity (33,200cfs); steady release, plus or minus 1,000 cfs for power	-45,000 cfs, plus or minus 1,000 cfs for power. The EIS provided for flows at least 10,000 cfs above the maximum allowable release in a minimum release year. For the MLFF alternative, that maximum release is 30,000 cfs, so the BHBF would be at least 40,000 cfs	45,000 cfs, plus or minus 1,000 cfs for power.
DURATION/ FREQUENCY	Duration: 7-14 days Frequency: Annually, as hydrology provides	Duration: 7-14 days Frequency: 1 in every 5 years, as hydrology provides	Duration: 2-4 days Frequency: Annually, as hydrology provides
HYDROLOGY	When projected storage in Lake Powell on January 1 is less than 19 maf. If projected storage is greater than 19 maf, releases are likely to be at or more than PP capacity	-When projected storage in Lake Powell on January 1 is less than 19 maf (the intent being to minimize releases above PP capacity)	—When projected storage in Lake Powell on January 1 is 21.5 maf or more
TIMING	March: -reform backwater channels prior to humpback chub spawning -more sediment likely available from tributaries in March -prior to peak recreational scason -however, other months to be considered through adaptive management	In the spring (to coincide with the May/June peak in the natural hydrologic cycle) or in late summer when, due to local thunderstorms, tributaries are expected so supply large quantities of sediment (especially silt and clay) and nutrients The exact scason and duration would be determined through adaptive management and scheduled through the Annual Operating Plan process	Sometime between January and July
OTHER FACTORS	-Would not be scheduled in a year when there is concern for a sensitive resource, such as sediment or an endangered species	-Must be sufficient quantities of sediment available -Would not be scheduled following a year in which a large population of young humpback chub is produced	Must be sufficient quantities of sediment availableWould not be scheduled in a year when there is concern for a sensitive resource, such as sediment or an endangered species
