

Science Center - Research

Grand Canyon's unique and varied resources have attracted scientists for more than 100 years. Much of what we know about the park's historical, biological and physical resources has been learned through past research. Yet, much still remains to be discovered. Forty to fifty research projects begin in Grand Canyon National Park each year. National Park Service staff lead some of these projects, but many more are proposed and led by scientists connected with other institutions. Some studies are designed to provide information for managing the park's resources and visitor services, but other studies delve into a wide range of subjects: geology, paleontology, ecology and archaeology to name a few. The park's Research Office was established to facilitate communication between scientists, educators, and park managers. The Research Office works with park managers to identify research priorities and to seek appropriate means of accomplishing high priority projects. We can also provide information about ongoing studies, and about opportunities for conducting new research. The most commonly requested information about permits, funding sources, current and past projects is included in files and links connected to these pages. Feel free to contact the Research Office directly if the information we've provided does not answer your questions about research in Grand Canyon National Park.
