

**April 24-Month Study**  
**Date: April 15, 2021**

**From:** Water Resources Group, Salt Lake City  
**To:** All Colorado River Annual Operating Plan (AOP) Recipients

**Current Reservoir Status**

Reservoir	March Inflow (unregulated) (acre-feet)	Percent of Average (%)	April 14, Midnight Elevation (feet)	April 14, Midnight Reservoir Storage (acre-feet)
Fontenelle	40,460	77	6,473.21	126,000
Flaming Gorge	67,600	66	6,025.37	3,173,900
Blue Mesa	28,600	79	7,464.12	392,900
Navajo	24,500	27	6,034.00	1,049,400
Powell	296,700	45	3,564.74	8,688,600

**Expected Operations**

The operation of Lake Powell and Lake Mead in this April 2021 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2021 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2020 24-Month Study projections of the January 1, 2021, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2021.

The August 2020 24-Month Study projected the January 1, 2021, Lake Powell elevation to be below the 2021 Equalization Elevation of 3,659 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell is operating under the Upper Elevation Balancing Tier for water year 2021. With an 8.23 million acre-foot (maf) release from Lake Powell in water year 2021, the April 2021 24-Month Study projects the end of water year elevation at Lake Powell to be below 3,575 feet. Therefore, in accordance with Section 6.B.1 of the Interim Guidelines, Lake Powell will continue to release 8.23 maf through the remainder of the water year 2021.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2021. In addition, Section III.B of Exhibit 1 to the Lower Basin Drought

Contingency Plan (DCP) Agreement is also governing the operation of Lake Mead in calendar year 2021.

The 2021 AOP is available for download at:

<https://www.usbr.gov/lc/region/g4000/aop/AOP21.pdf>.

The Interim Guidelines are available for download at:

<https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf>.

The Colorado River DCPs are available for download at:

<https://www.usbr.gov/lc/region/programs/dcp.html>.

**Fontenelle Reservoir** -- As of April 13, 2021, the Fontenelle Reservoir pool elevation is 6473.20 feet, which amounts to 38 percent of live storage capacity. Inflows for the month of March totaled 40,000 acre-feet (af) or 77 percent of average.

Fontenelle's releases are currently set at 825 cfs. This release is scheduled to be maintained through at least April.

The April final forecast for unregulated inflows into Fontenelle for the next three months projects below average conditions. April, May, and June inflow volumes amount to 60,000 af (70 percent of average), 80,000 af (49 percent of average), and 185,000 af (62 percent of average), respectively.

The 2021 water year unregulated inflow volume is forecasted to be 691,000 af (64 percent of average) based on the April forecast.

The August 27, 2020, Fontenelle Working Group meeting minutes are available online on USBR's website at <https://www.usbr.gov/uc/water/crsp/wg/ft/ftcurrnt.html>. The next Fontenelle Working Group meeting is scheduled for 10:00 am on April 22, 2021. Due to the ongoing COVID pandemic this meeting will be held virtually using WebEX. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

**Flaming Gorge** -- As of April 9, 2021 Flaming Gorge Reservoir pool elevation is 6025.37 feet, which amounts to 85 percent of live storage capacity. Unregulated inflows for the month of March is approximately 68,000 acre-feet (af), which is 67% of the average March unregulated inflow volume. Flaming Gorge Dam average daily release is currently 860 cfs.

The April final forecast for unregulated inflows into Flaming Gorge for the next three months projects below average conditions. April, May, and June forecasted unregulated inflow volumes amount to 95,000 af (71% of average), 120,000 af (49% of average), and 205,000 af (53% of average), respectively.

The April water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 530,000 acre-feet (54% of average). The snowpack as of April 9, 2021 is 79% of median for the Upper Green Basin.

Reclamation is planning to hold the next Flaming Gorge Working Group meeting on April 15, 2021 at 10:00 am MDT via WebEx. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186.

**Aspinall Unit Reservoirs** – As of April 6, 2021 releases from Crystal Dam are approximately 1200 cfs. Gunnison Tunnel diversions have begun for the irrigation season and are currently about 700 cfs. As temperatures rise and irrigation gets into full swing, diversions will gradually increase to about 1000 cfs in the coming month. Flows of the Gunnison River in the Black Canyon are being maintained above 400 cfs and are currently about 500 cfs.

The unregulated inflow volume in March to Blue Mesa was 28,595 af (79 percent of average). Unregulated Inflow volumes forecasted for Blue Mesa for the next three months (and April, May and June) are projected to be: 56,000 af (73 percent of average), 140,000 af (63 percent of average) and 180,000 af (69 percent of average), respectively. The April 24-Month Study is reflective of these new forecasts.

The 2021 water year unregulated inflow volume is projected to be 644,265 af (67 percent of average). The water supply period (April-July) for 2021 is forecasted to have 440,000 af of unregulated inflow (65 percent of average). At this point in the year there is a great deal of uncertainty for how the year will ultimately turn out. Current forecasting projects at a probability of 80 percent that the water year unregulated inflow volume to Blue Mesa will be in the range from 531,000 acre-feet to 869,000 acre-feet.

Blue Mesa is not projected to fill in 2021 under the most probable inflow scenario. Blue Mesa is projected to be at a peak elevation of approximately 7,488 feet by late July, 2021. This will be down approximately 31 feet from the full pool elevation (7,519.4 feet) and water storage in Blue Mesa at this time will be approximately 564,000 acre-feet which is 68 percent of live capacity.

The Aspinall Unit Operations Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Operations Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next Operations Group meeting will be held virtually on April 22, 2021 at 1:00 pm MDT. Contact Erik Knight in the Grand Junction Area Office at (970) 248-0629 to get the web address for the virtual Operations Group meeting or for additional information.

**Navajo Reservoir** – On April 7th, the daily average release rate from Navajo Dam was 400 cfs while reservoir inflow was averaging approximately 1,052 cfs. The water surface elevation was 6033.6 feet above sea level. At this elevation the live storage is 1.045 maf (61 percent of live storage capacity) and the active storage is 0.383 maf (37 percent of active storage capacity). NIIP is diverting 233 cfs. The San Juan-Chama project is currently diverting 264 cfs from the basin above the reservoir. The river flow measured at the Animas River at Farmington USGS gage was at 249 cfs. River flow at the San Juan River at Four Corners USGS gage was 488 cfs.

Releases from Navajo Dam are made for authorized purposes of the Navajo Unit and are pursuant to the Record of Decision for the Navajo Reservoir Operations. Releases target the San Juan River Recovery Implementation Program's recommended downstream baseflow range of 500 cfs to 1,000 cfs through the critical habitat reach of the San Juan River (Farmington, NM to Lake Powell). Current modeling shows the release will most likely vary between 350 and 600 cfs to accomplish this for the remainder of winter and early spring. The current calculated baseflow average is 473 cfs, which is just below the SJRIP's recommended range. A release increase has been scheduled to bring the target baseflow back up to 500 cfs.

Navajo was at 6033.3 ft of pool elevation and 1,042,226 acre-ft of storage by the end of March, which was 81 percent of average for the end of the month. The release averaged 410 cfs (as measured at the USGS San Juan at Archuleta gage) and totaled 25,079 af, which was 43 percent of average for the month. Preliminary modified unregulated inflow (MUI) into Navajo was 24,545 af. Calculated evaporation for the month was 1,316 af. Navajo had a net storage loss of 9,714 af in March.

The most probable MUI forecast (adjusted to include observed flows and the short term forecast) for April, May, and June, is 82 kaf (48 percent of average), 155 kaf (56 percent of average), and 125 kaf (56 percent of average), respectively.

The April-July runoff forecasts are as follows:

Min Probable: 270 kaf (37 percent of average, an increase of 25 kaf since the last forecast)

Most Probable: 395 kaf (54 percent of average, no change since the last forecast)

Max Probable: 565 kaf (77 percent of average, a decrease of 40 kaf since the last forecast)

Based on the current storage levels and inflow forecast, there is no planned spring peak release this year.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir. The next meeting will be held virtually on Tuesday, April 20th, at 1:00 PM.

### **Glen Canyon Dam / Lake Powell**

#### **Current Status**

The unregulated inflow volume to Lake Powell during March was 297 thousand acre-feet (kaf) (45% of average). The release volume from Glen Canyon Dam in March was 700 kaf. The end of March elevation and storage of Lake Powell were 3566.71 feet (133 feet from full pool) and 8.84 million acre-feet (maf) (36% of live capacity), respectively.

The six-month period from April to December 2020 is one of the driest periods on record. Current conditions resemble 2002, 2012, 2013 and the beginning of 2018, four out of the five driest years on record.

#### **Current Operations**

The operating tier for water year 2021 (September 2020 through October 2021) was established in August 2020 as the Upper Elevation Balancing Tier, consistent with Section 6.B of the Interim Guidelines. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2021 will be governed by the Upper Elevation Balancing Tier. With an 8.23 maf release from Lake Powell in water year 2021, the April 2021 24-Month Study projects the end of water year elevation at Lake Powell to be below 3,575 feet. Therefore, in accordance with Section 6.B.1 of the Interim Guidelines, Lake Powell will continue to release 8.23 maf through the remainder of the water year 2021.

In April, the release volume will be approximately 628 kaf, with fluctuations anticipated between about 8,000 cubic feet per second (cfs) in the nighttime to about 13,651 cfs in the daytime, and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for May is 628 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,100 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 30 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

### **Inflow Forecasts and Model Projections**

The forecast for water year 2021 unregulated inflow to Lake Powell, issued on April 2, 2021, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume this year will be 4.90 maf (45% of average).

There is significant uncertainty regarding next season's snowpack development and resulting runoff into Lake Powell. Reclamation updates the minimum and maximum probable forecasts four times a year: January, April, August, and October. Under the January minimum probable 24-Month Study, the forecast projected Lake Powell's water surface elevation to fall below 3,525 feet in 2022. This model result initiated enhanced monitoring and coordination under the Agreement for Drought Response Operations at the Initial Units of the Colorado River Storage Project Act (Drought Response Operations Agreement "DROA"). This model result does not initiate operational changes to Reclamation facilities. Modeling results in the February through April 24-Month Studies minimum probable Lake Powell elevation projections continue to fall below 3,525 feet in 2022.

The Upper Division States and the Upper Colorado River Commission (UCRC) enhanced monitoring and coordination involves a monthly meeting communicating monthly model results from the minimum, most, and maximum projected operations. Please note that 90% of the suite of results are expected to be above the minimum probable projections and there is currently a 10% expectation to be below elevation 3525 feet under the minimum probable scenario.

The minimum probable 24-Month Study will continue showing operations under the Lower Elevation Balancing Tier (LEBT) that is pursuant to the 2007 Record of Decision on the Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines).

The DROA coordination will continue until either (i) the minimum probable projected elevation remains above 3,525 feet for 24 months or (ii) the process moves to the next step when the most probable projected elevation indicates Powell elevations below 3,525 feet and a Drought Response Operations Plan is implemented.

The April forecast for water year 2021 ranges from a minimum probable of 3.33 maf (31% of average) to a maximum probable of 7.49 maf (69% of average). There is a 10% chance that inflows could be higher than the current maximum probable forecast and a 10% chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast of 4.90 maf unregulated inflow, the April 24-Month Study projects Lake Powell elevation will end water year 2021 near 3,557.07 feet with approximately 8.03 maf in storage (33% of capacity). Note that projections of elevation and storage for water year 2021 have significant uncertainty at this point in the season. Projections of end of water year 2021 elevation and storage using the minimum and maximum probable inflow forecast from and results from the April 2021 model runs are 3,542.05 feet (7.03 maf, 29% of capacity) and 3,579.58 feet (9.90 maf, 41% of capacity), respectively. Under these scenarios, there is a 10% chance that inflows will be higher, resulting in higher elevation and storage, and 10% chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2021 will be 8.23 maf as determined under Section 6.B.1 of the Interim Guidelines.

### **Upper Colorado River Basin Hydrology**

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 21-year period 2000 to 2020, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2020 is the lowest 21-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.62 maf, or 80% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2020 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43% of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2021 unregulated inflow to Lake Powell is projected to be 4.90 maf (45% of average).

At the beginning of water year 2021, total system storage in the Colorado River Basin was 28.88 maf (48% of 59.6 maf total system capacity). This is a decrease of 2.77 maf over the total storage at the beginning of water year 2020 when total system storage was 31.64 maf (53% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to the now current level of 48% of capacity at the beginning of water year 2021. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2021 is approximately 24.60 maf (41% of total system capacity). The actual end of water year 2021 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow.
